DESIGN DEVELOPMENT

utilized revit structure design authoring & alternates to evaluate design options and system costs for the atrium's curtain wall and the structural pour strip

prefabrication of the glazing system is not cost effective for this application replacement of the pour strip with a expansion joint is 24% more expensive

additional costs: \$181,253

minimal schedule savings

PRECONSTRUCTION

utilized exported revit structure data with cost database reference to evaluate accuracy of model based-estimates

- leveraging model-based estimates requires additional modification to component parameters
- structural steel elements produce the most dependable results in quantity takeoff exports

80% time savings up to 99.5% accuracy

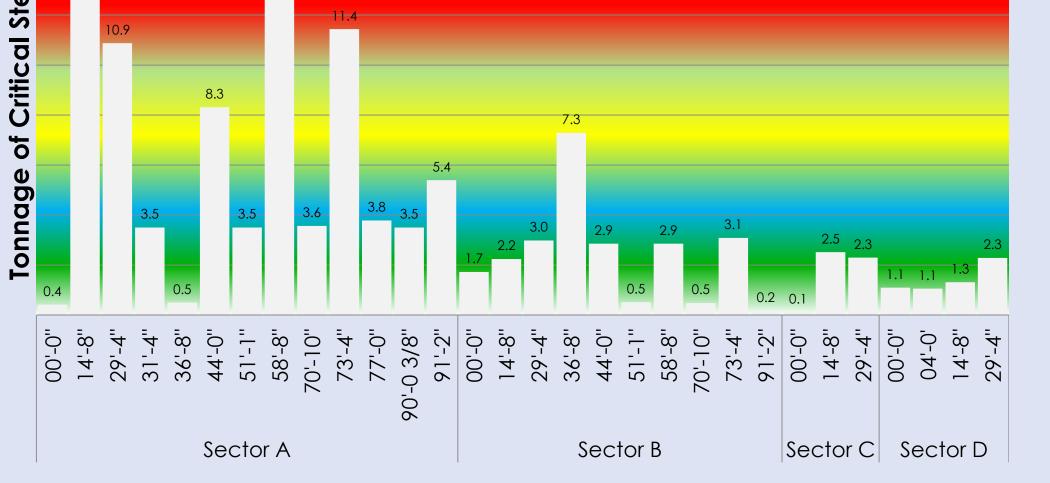

utilized exported revit structure data within microsoft excel pivot chart to optimize erection workflow and expense

senior thesis 2011 – 2012

implementation of VDC methods to identify data trends in design, construction, and facility management

DASHBOARD Concept recognized 77% crane inefficiency
revised the erection sequence to erect by sector with two crane, reducing the schedule by two weeks

total project savings: \$315,727

utilized bluebeam revu, dreamweaver, and microsoft silverlight to identify methods and processes to implement various interfaces for facility document management

achieved the goal of a single page, interactive, online collaboration interface, which provides access to updatable and variable file types

provided feasible document turnover interface for owner development

FACILITY TURNOVER
