Fig. S1 Current generation from single and two-chamber MFCs with 50 mM PBS (phase 2) and different NaCl concentrations [60 (phase 3), 120 (phase 4), and 240 mM (phase 5)]. (open/closed symbol represents data from duplicate reactors).
Fig. S2 CE and COD removal with different catholyte concentrations in two-chamber MFCs (solid bars and filled circles) and a single-chamber MFC (open bar and open circle). (Error bars represent the standard deviation from at least three batch cycles).
