Figure S1 Carbon fiber brushes used as MFC anodes for configurations R3, R5 and R8.
Figure S2 Power density curves obtained using the multi-cycle method (MC, solid symbols) and single-cycle method (SC, white symbols) for configuration R3 (Δ), R5 (○) and R8 (□).
Figure S3 Nyquist plots of whole cell impedance spectra at OCP for the four rectangular vertical reactors configurations, measured between the anode (working electrode) and the cathode (counter and reference electrode) (NOTE: noise signal at lower frequencies was removed from the figure).
Figure S4 Power density obtained using the single-cycle method for configurations R3-2 (□) and R8C (◊) in fed-batch (solid symbols) and continuous flow mode (white symbols).
