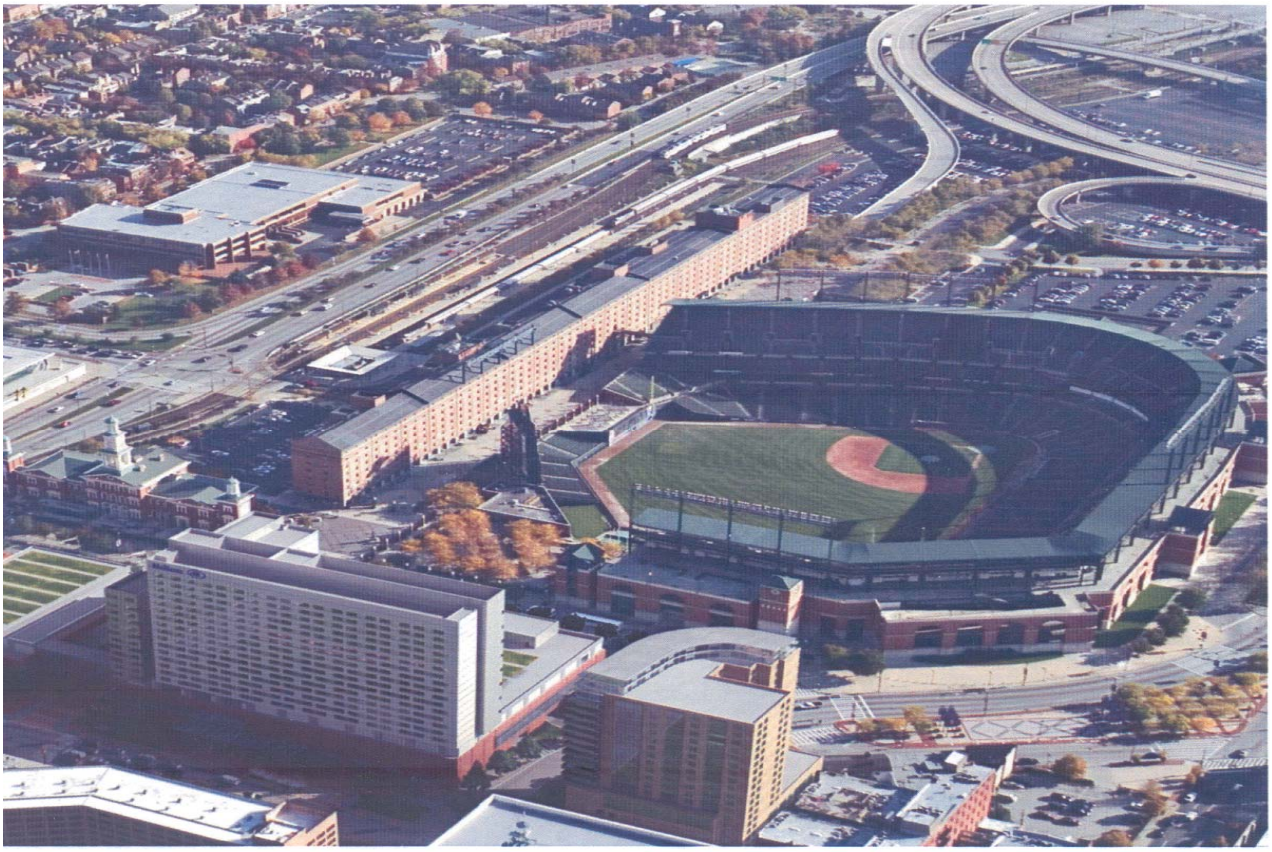
Hilton Baltimore Convention Center Hotel

Western Podium

Baltimore, MD



CHRIS SIMMONS
Structural Option

Faculty Consultant: Dr. Ali M. Memari

Final Report

April 2, 2010

Baltimore Hilton
Baltimore, MD

Project Overview
Size: 850,000 Sq. Feet
Cost: $250 Million
Construction Dates: February 2006- August 2008
Delivery Method: Design-Build
Building Use: 757 hotel guest rrooms, grand/junior ballrooms, conference/meeting rooms

Project Team
Owner: Baltimore Hotel Corp.
Architecture: RTKL
Structural: RTKL, Hope Furrer
Mechanical: Southland Industries
Electrical: M.C. Dean
GC: Hensel Phelps

Architecture
-Walking bridge over Eutaw St. connecting 3-story east podium and 21 story west podium
-Lower levels enclosures are brick and glazed aluminum curtain wall, while towers are metal panel walls with fixed aluminum windows
-Green roof utilized, and towers have PVC membrane roof

MEP
-8 AHU's (274,000 cfm) serving VAV systems in public spaces and lower levels
-4 MAU's (86,000 cfm) supply conditioned outdoor air to guest rooms
-1100 KW Emergency Generator
-2000A 480/277 serves the East Podium
-Two 4000A 480/277 serves the West Podium

Structural
Foundation
- -Columns bearing on drilled caissons
- -Spread footings bearing on reinforced soil

Lateral Systems
- -Curtain walls
- -Stairwells and Elevator Shaft walls are shear walls

Gravity System
- -Concrete columns
- -Concrete frames
- -Steel brace frames and trusses

EXECUTIVE SUMMARY

The goal of the redesigning of the floor system was to decrease the slab thicknesses of each floor, while affecting the column and beam systems as little as possible. This was achieved by changing the existing two-way flat plate floor system to a two-way post-tensioning system. Each floor decreased by 1 to 2 inches except for the first floor and the third floor which increased by 2 inches and 1 inch respectively. This system was designed with the original column and beam layout and sizes, satisfying that part of the goal of the design. The post-tensioning floor system decreased the overall weight of the building by about 12000 kips. With this decrease in building weight the seismic base shear and overturning moment decreased by 140 kips and 20300 foot-kips respectively compared to the existing structure. Also with the decrease in building weight, the foundation system had to be looked at and analyzed to see if any changes needed to be made. It was noted that a decrease in weight wouldn't provide any need to change the existing caisson foundation system.

Changing the floor system to post-tensioning created a change in the floor system costs and construction time. A cost and schedule analysis was done for both the existing two-way flat plate and the post-tensioning system. The PT system was found to cost less but take 22 more working days to construct. It cost about $1.1 million less than the two-way system, but would cost the hotel money for not being able to be opened for those 22 plus days.

There was an area in the building that needed to be looked at acoustically. That area was the pool and fitness room area on the fourth floor. Directly below the pool and fitness areas are meeting rooms. With the current floor system in that area of a concrete slab on metal decking, it was noticed that the pool wouldn't provide an acoustical problem to the meeting room below because the water would absorb the sound. However the fitness room needed to have the floor redesigned to a floating floor so that the transmission of sound down into the meeting room would decrease.

INTRODUCTION

The Hilton Baltimore Convention Center Hotel (HBCCH) is located right in downtown Baltimore next to the Baltimore Orioles stadium Camden Yards, and located blocks away from Inner Harbor. HBCCH is broken up into two podiums, East and West. The eastern podium is a 4-story building that houses a junior ballroom, meeting rooms and a multipurpose restaurant. The western podium is a 21-story building that houses the main hotel lobby, parking garage, grand ballroom with corresponding kitchen, meeting rooms, pool/health club, and 757 hotel rooms. The grand ballroom has moveable partitions located in the ceiling that allow multiple events to take place there. The western podium offers over 900,000 SF of hotel space. The structure of the western podium consists of concrete beams, columns and shear walls to resist lateral loading. The green roof above the grand ballroom is supported by special joists and whiles the pool above the grand ballroom is supported by steel beams.

FOUNDATION SYSTEMS

The foundation of the western podium consists of caissons and spread footings. The spread footings will bear on firm natural soils and have a minimum bearing capacity of 4ksf. The drilled caissons will have straight shafts to bear on gneiss rock and have a minimum safe bearing capacity of 100ksf. The depths of the bottoms of the caissons vary from 14 feet all the way up to 32 feet below level B2's floor slab. The compressive strength of the drilled caissons and spread footings are 3500 psi, while the caisson caps that the columns bear on have a compressive strength of 4000 psi. A typical caisson section is shown in figure 1.

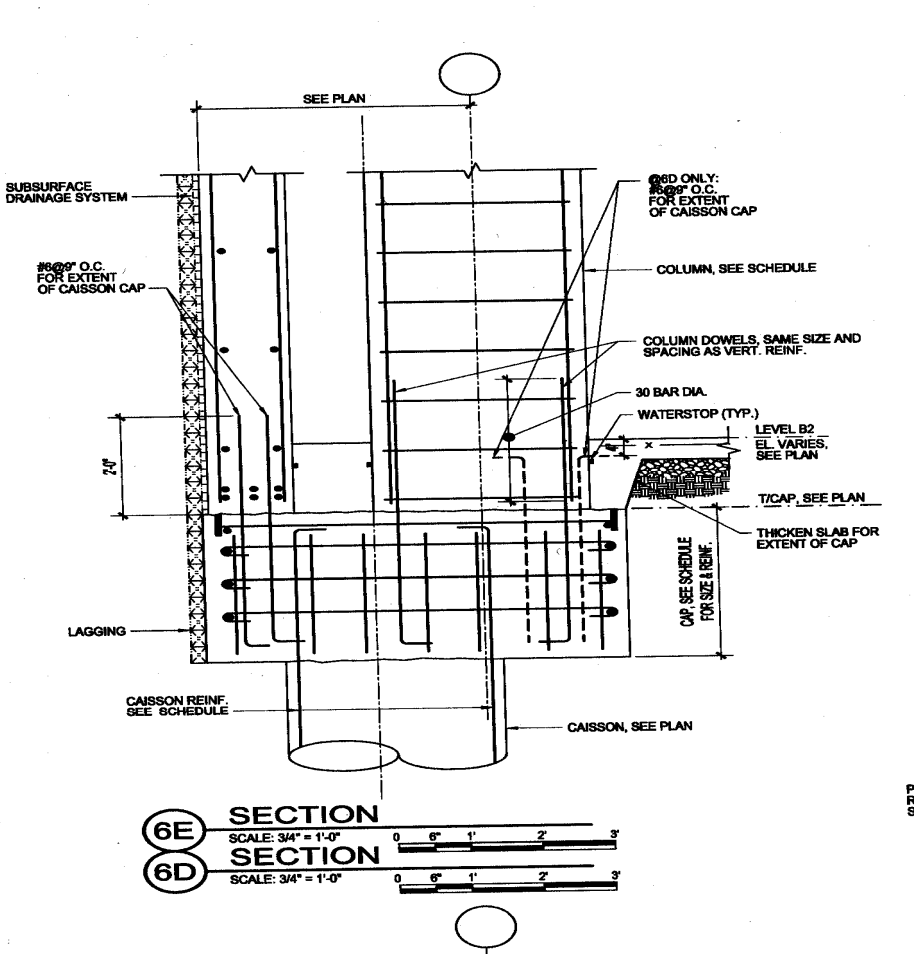

Figure 1 – Caisson Section

FLOOR SYSTEM

The floor system consists of two-way slabs whose thicknesses range from 8" thick on the floors with hotel rooms to 11" in the underground parking garage. The slabs are reinforced with 6x6-W1.4xW1.4 WWF, except for the slab-on-grade which is reinforced with 6x6-W2.1xW2.1 WWF as seen in Fig. 2. Drop panels are located on the B1, 1st, Mezzanine level, 2nd, 3rd, and 15th floors. The drop panels vary from 5" up to 11" in thickness. Typical spans for floors consisting of hotel rooms are 26'-10". On the fourth floor, the floor system changes to a concrete slab on metal decking. This is because of the pool area as well as the weight room area. A detail of the floor system for that area is shown in Fig. 2

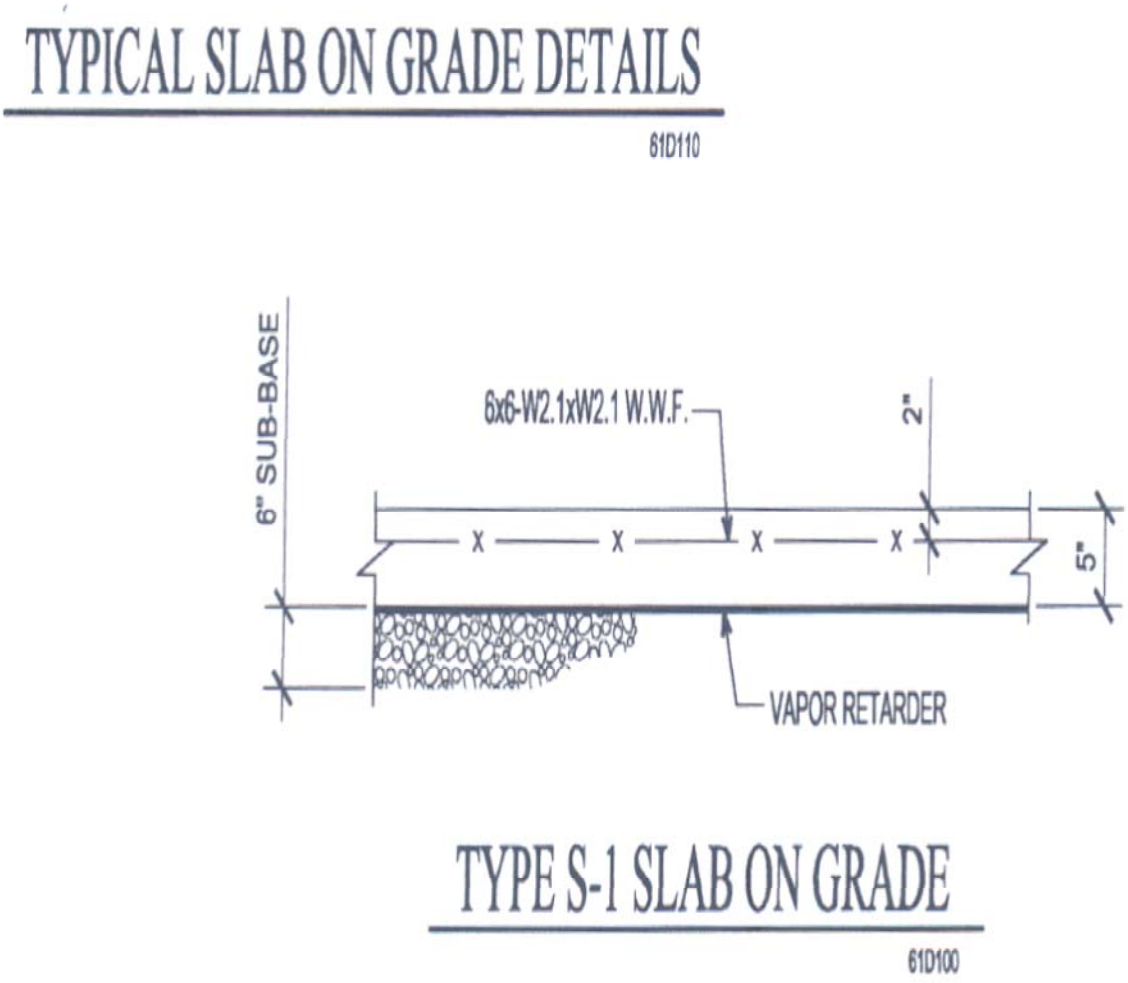

Figure 2 – Slab on Grade Detail

ROOF SYSTEM

As shown in Fig. 3, the roof system is either type R-1 or R-2 roof construction. Type R-2 roof construction is used for the green roof above the grand ballroom and exercise room while type R-1 roof construction is used for the roofs located on the 15th and 21st floors. Fig. 4 shows the transition from the green roof assembly to the corresponding roof construction assembly.

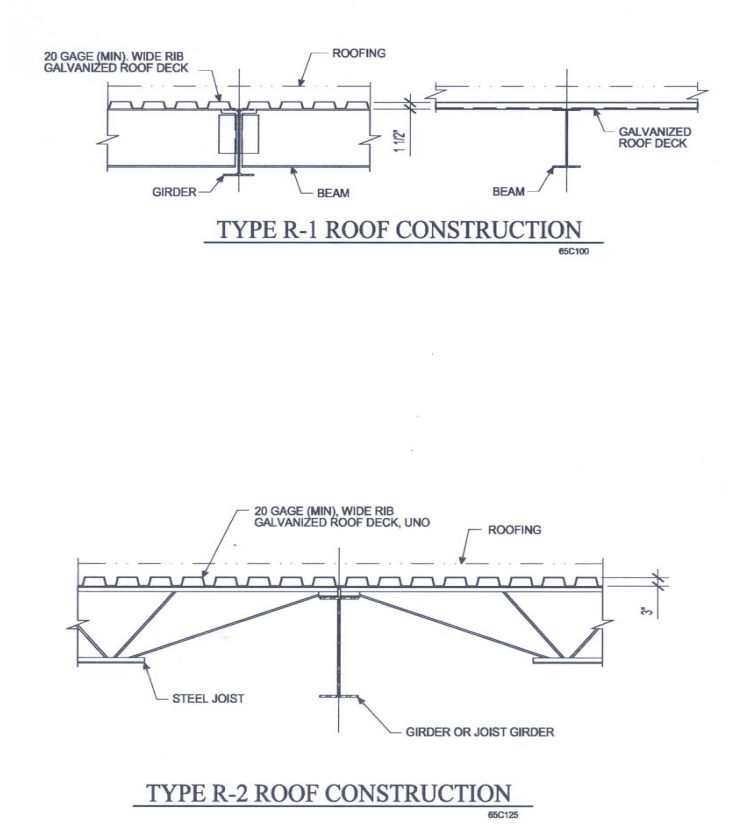

Figure 3 - Roof Construction Details

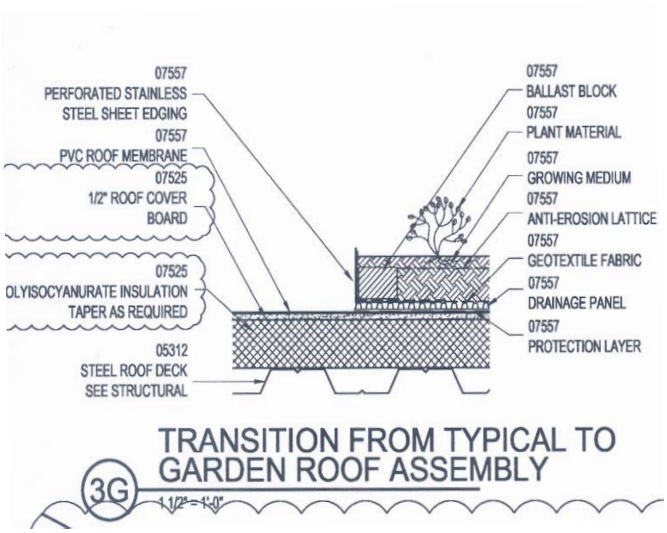

Figure 4 – Green Roof Transition

LATERAL SYSTEM

The lateral resisting system for wind and seismic loads consist of a number of steel brace frames that are located between the 3rd floor and the 4th floor roof. The load that is from wind and seismic is also transferred from each individual floor to the concrete beams and then to the concrete columns. A shear wall system is used as well for resisting wind and seismic loads. Shear walls are located around the elevator shafts and stairwells as shown in the ETABS model in Fig. 5

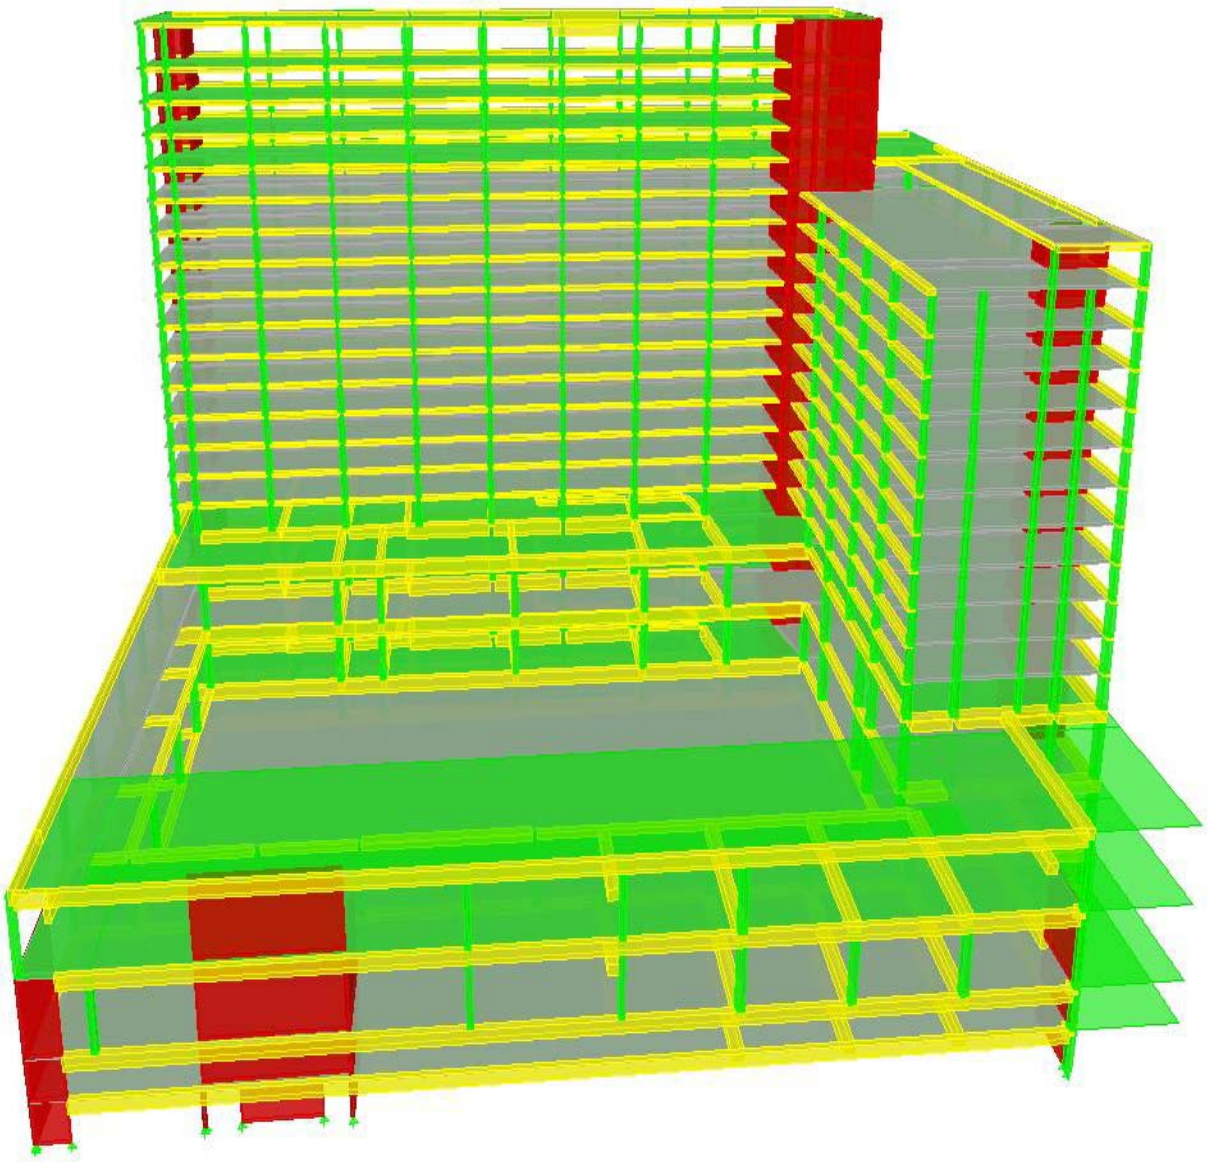

Figure 5

COLUMN SYSTEM

The layout of the column system is a very uniform layout consisting of typical exterior bays of 26’-10” x 18’-8” and interior bays of 26’-10” x 19’-7”. All columns consist of either a gravity resisting member or a combination of lateral and gravity resisting members. Column sizes vary from 12” x 18” columns to 44” x 30” Columns. Sloped columns can be found on the second and third floors of the western podium. A typical column layout for the hotel room floors is shown in Fig. 6.

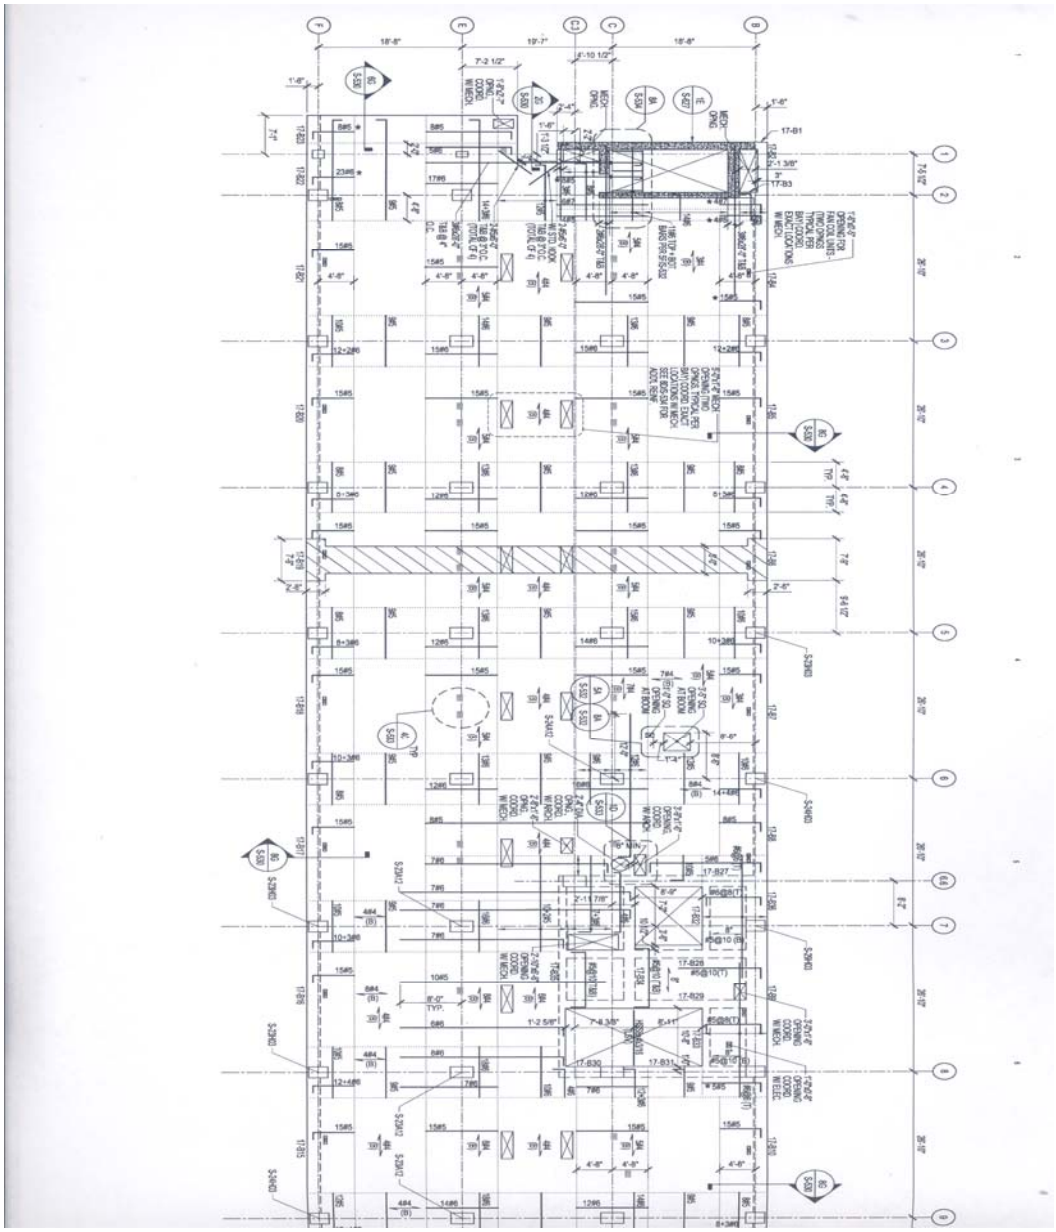

Fig. 6 – Typical Framing Plan

PROBLEM STATEMENT

The Baltimore Hiltons current gravity system design is a two-way flat plate slab with drop panels on six floors. This gravity system was found to be the most efficient system available. During Technical Report II, A Structural Study of Alternative Floor Systems, it was found to be the most effective out of the four systems analyzed. However a fifth system, post-tensioned concrete slab, was mentioned but not analyzed. A post-tensioned floor system would hopefully allow a larger floor-to-ceiling height as well as longer spans, faster construction and reduced weight compared to two-way flat plate slabs. The framing system underneath the pool and fitness room consists of steel beams and joists. Around and underneath the pool there are two levels of steel beams. One level is around the pool while there is another level of steel beams that run directly beneath the pool. A different system that could be instead of the beams is staggered trusses. Staggered Trusses would allow for a larger span between members as well as a reduced weight compared to just using steel beams.

PROPOSED SOLUTION

As stated above a proposed solution for the gravity system would be to redesign all the floor slabs using post-tensioning design. It was noted in Technical Report II that this could be a more efficient system than two-way flat plate slabs but it was never analyzed. Using post-tensioned slabs would allow for smaller slab thickness, which in turn create larger floor-to-ceiling heights and decrease the weight of the building. The slabs will be designed so as not to disrupt the current column and beam layout as much as possible. With a decrease in slab thickness and weight of the building, the foundations will be looked at to see if any changes need to be made to the existing foundational structure. Also a seismic analysis will be determined to see how much the base shear changed with the change of floor system.

STRUCTURAL DEPTH STUDY - FLOOR SLAB REDESIGN

DESIGN LOADS

In order to redesign the floor system from two-way flat plate to a two-way post-tensioned system, first the loads on the system were to be determined. All of the design loads for this technical report were calculated referencing ASCE 7-05: *Minimum Design Loads for Buildings and Other Structures*. All dead, live and snow loads can be seen in Table 1 below. Note that there is no live load reduction considered in any of the live loads shown.

Table 1 - Gravity Loads

Description	ASCE 7-05	RTKL Value	Design Value
DEAD (DL)			
Concrete	150pcf	150pcf	150pcf
Ceiling, Mech, Ducts, etc.	20-25psf	5-20psf	20psf
LIVE (LL)*			
Private Hotel Rooms	40psf	40psf	40psf
Ballroom	100psf	100psf	100psf
Corridors (first floor, main lobby)	100psf	100psf	100psf
Corridors (serving private hotel rooms)	100psf	40psf	100psf
Aerobic/Exercise Rooms	100psf	100psf	100psf
Pool Deck	75psf	80psf	75psf
Green Roof	100psf	100psf	100psf

Roofing	20psf	30psf	20psf
SNOW (S)			
Snow	20psf	20psf	20psf
* Live load reductions were not taken into consideration in the design.			

Design Process

Slab Design

ADAPT-PT 8.00 was used as the primary analysis software for the post-tensioning floor system design. ACI 318-05 and IBC 2006 were selected as the code design criteria for the ADAPT system. Each floor was analyzed separately with each analyzed multiple times depending on the slab thickness chosen. Each floor was then taken and separated into individual bays depending on tributary width of the column lines. A smaller slab thickness than the current designs slab thickness was chosen and analyzed. When a chosen slab thickness didn't work at first the PT force was changed so that P/A was above the code minimum of 125 kips and below the recommended maximum of 300 kips. If changing the PT force didn't work, the tendon layout was changed. Both of those were changed until the service and initial stresses in both tension and compression were ok according to ADAPT, as can be seen in Fig. 7 and Fig. 8 below. When that didn't solve the problem the slab thickness was increased. Sometimes a floor had to be broken into multiple slabs to allow for certain slab thicknesses to work. This was done for each tributary column width of each floor. From that the most critical design was taken as the design for that floor. After all floors were designed according to ADAPT, hand calculations were done of the upper hotel floors to see if analysis by hand was consistent with the output determined from ADAPT. Fig. 10 shows an image of one of the areas taken into account while using ADAPT for analysis. The area is on the upper hotel room floors, between column lines B-3 and F-3.

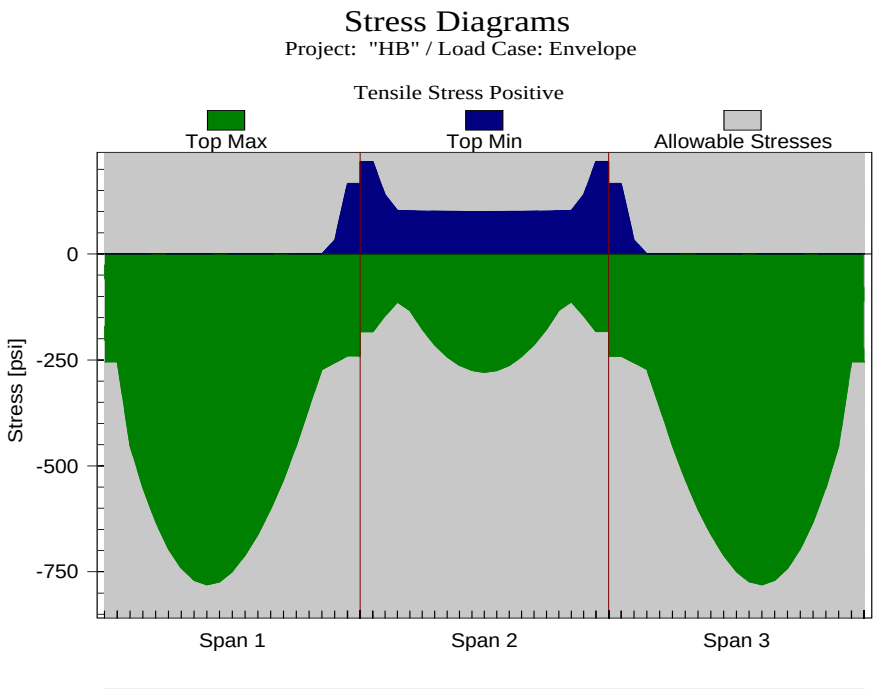

Figure 7

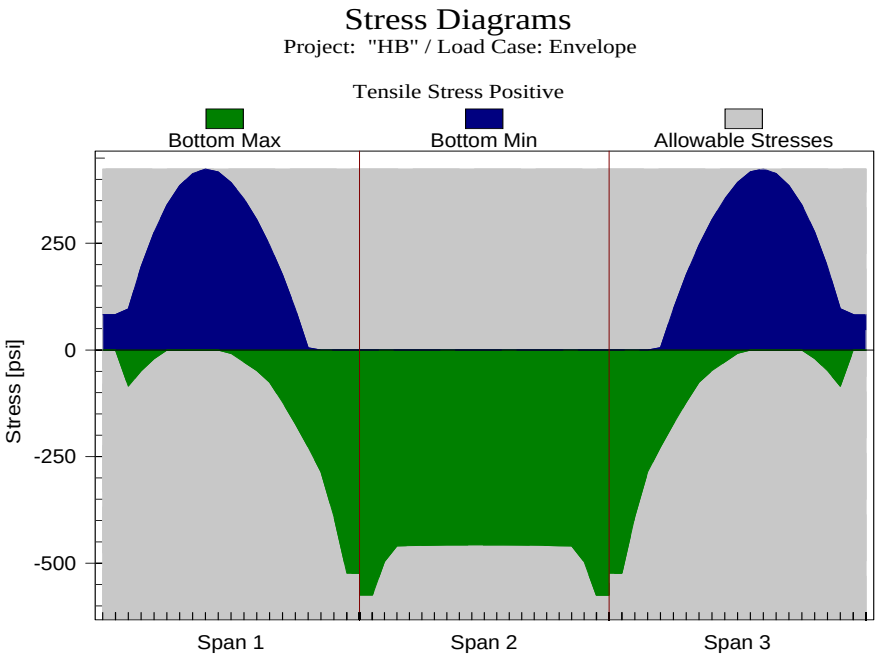

Figure 8

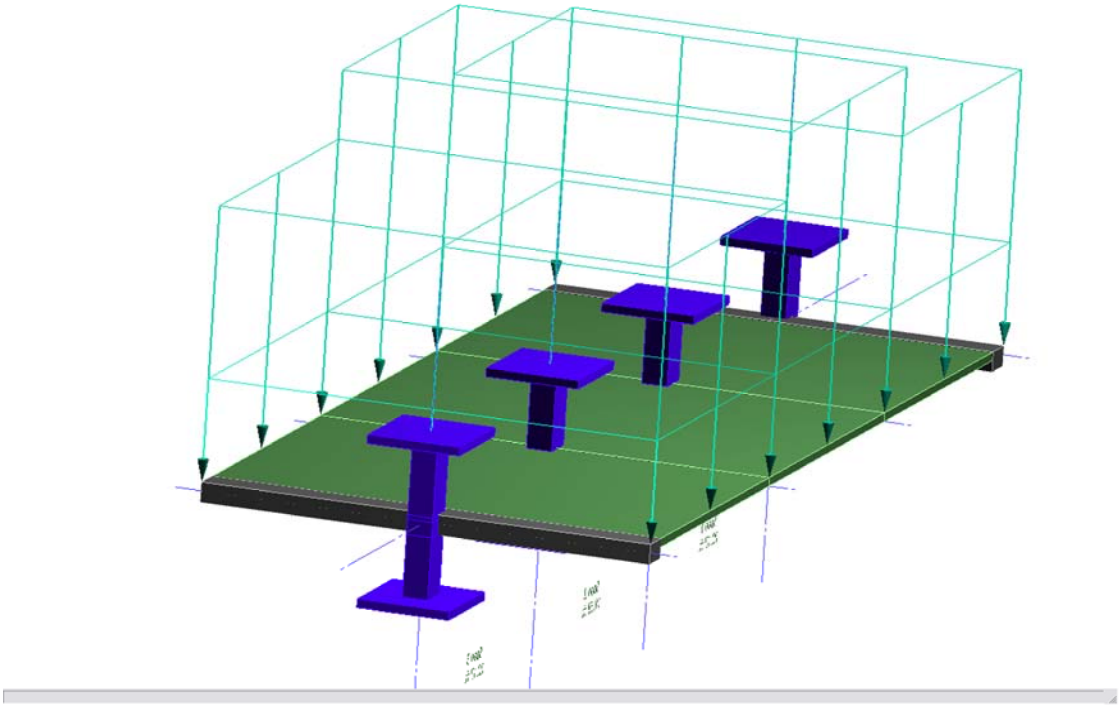

Figure 9

After ADAPT was finished analyzing a report was obtained with all information regarding the slab design, ranging from number of tendons, amount of rebar needed to deflection. The floor slabs deflection was observed to see if any other changes needed to be made in case the deflection was above the limit.
Fig. 10 shows the deflection diagram from the slab area in Fig. 9 above.

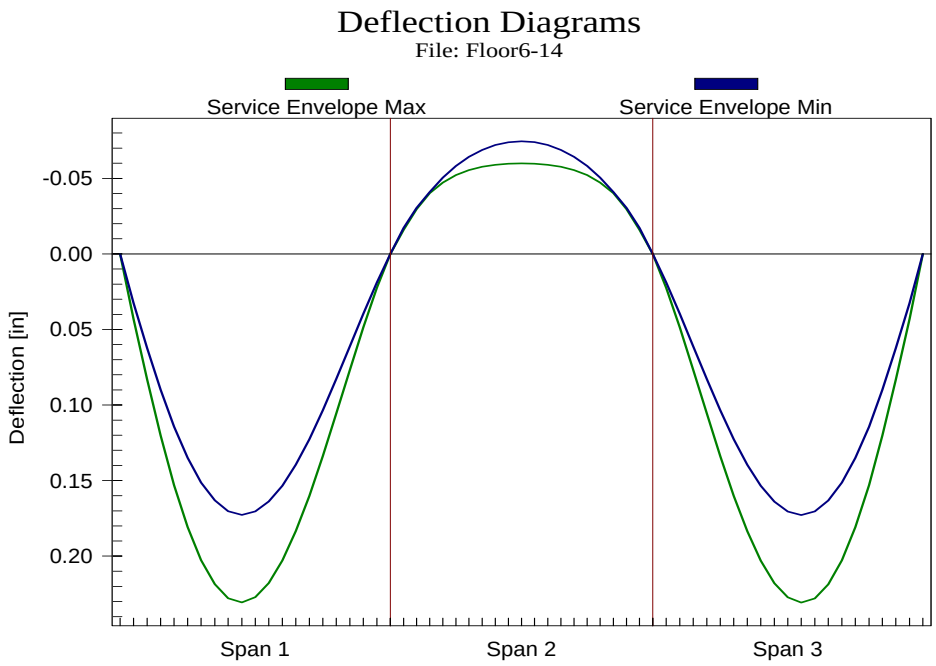

Figure 10 – Deflection Diagram

Once all column tributary widths on each floor were analyzed with the most critical design was taken and then compared to the existing structures slab thickness. Table 2 shows the comparison between the designed post-tensioning floor system and the existing two-way flat plate floor system.

Table 2 - Floor Slab Thickness Comparison			
Level	Designed Two-Way Post-tensioning Thickness (in)	Existing Two-Way Flat Plate Thickness (in)	Change in Thickness (in)
Floor 1	11	9	2
Mezzanine	8	9	-1
Floor 2	8	9	-1
Floor 3	10	9	1
Floor 4	6	8	-2
Floor 5	6	8	-2
Floor 6	6	8	-2
Floor 7	6	8	-2
Floor 8	6	8	-2
Floor 9	6	8	-2
Floor 10	6	8	-2
Floor 11	6	8	-2
Floor 12	6	8	-2
Floor 13	6	8	-2
Floor 14	6	8	-2
Floor 15	6	8	-2
Floor 16	6	8	-2
Floor 17	6	8	-2
Floor 18	6	8	-2
Floor 19	6	8	-2
		Total	-31

From this comparison table it was seen that the designed two-way post-tensioning floor slabs were smaller in thickness on all floors except Floor 1 and Floor 3 and the existing two-way flat plate floor system. This resulted in a total change in floor slab thicknesses of 31 inches.

Column Design

While using ADAPT-PT 8.00 the original column layout and sizes were used during the analysis, so therefore no new column designs or layouts were used in the design of the two-way PT floor system.

Beam Design

While using ADAPT-PT 8.00 the original column layout and sizes were used during the analysis, so therefore no new beam designs or layouts were used in the design of the two-way PT floor system.

SEISMIC ANALYSIS

After the slab thicknesses were determined and designed, a seismic analysis was done to see if the new building would the seismic requirements according to code. With the decrease in slab thicknesses the building weight decreased, therefore decreasing the story forces, shear and moments on the building. In order to calculate the seismic forces on HBCCH, Chapters 11 and 12 were referenced from ASCE 7-05. HBCCH was assumed to have a rigid diaphragm which allowed for the use of the Equivalent Lateral Force Procedure found in Section 12.8 of ASCE 7-05. The variables used in this procedure are located in Table 3a.

			Overturning Moment(k-ft)	146535.8923

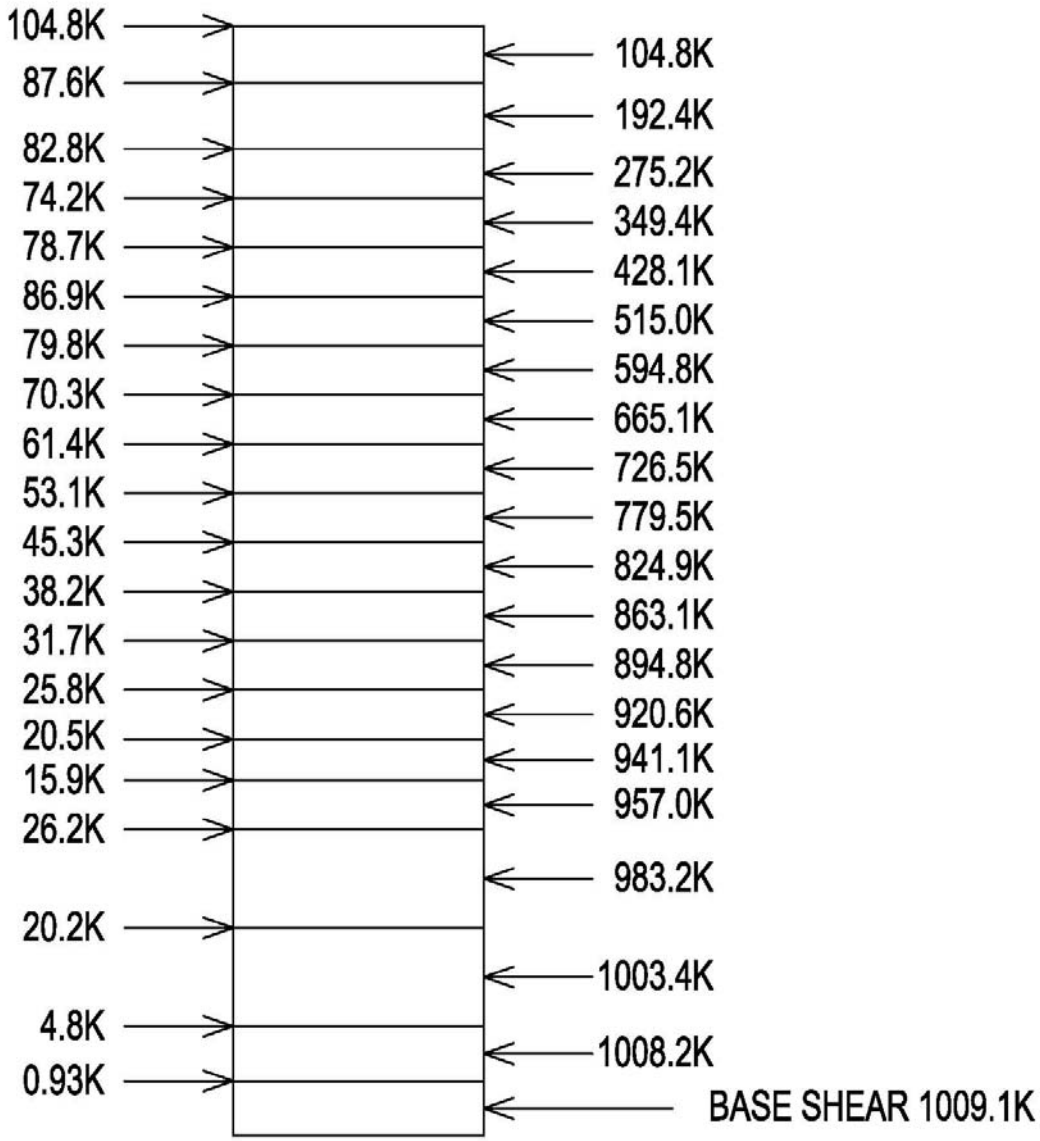

Figure 11 Seismic Design Diagram

After running the seismic analysis it was seen that the base shear decreased by over 140 kips, while the overturning moment decreased by about 20300 foot-kips. This was all due to the decrease in weight of the building by decreasing the floor thickness.

Construction Management Breadth

The construction management breadth consists of a basic schedule analysis and a basic cost analysis. The schedule compared how long each floor system would take to construct. The cost analysis compared how much each floor systems materials and labor costs would cost to construct.

Cost Analysis

The purpose of the cost analysis is to compare how much more or less the designed two-way post-tensioning system will cost compared to the existing two-way flat plate concrete system. Each system was broken down into each individual portion of the construction elements needed for each system. A few examples of the materials needed are rebar, concrete mix, and materials needed for the curing process. Materials that both systems need the same amount of like formwork were not taken into the cost comparison as both costs would cancel out when the comparisons were made. *RSMeans CostWorks* was used for the cost analysis. The following table shows the cost comparison

Table 4 - Floor System Cost Comparison

Material	Designed Two-Way Post-tensioning (Dollars)	Existing Two-Way Flat Plate (Dollars)	Change in Cost
Concrete Mix (4000 PSI for Existing and 5000 PSI for PT)	1,853,245.98	2,121,912.45	-$268,666.47
Mild Reinforcing Steel	299,136.16	1,585,937.40	-$1,286,801.24
Prestressing Steel Tendons	541,451.52	0	$541,451.52
Concrete Placing	358,553.79	431,761.05	-$73,207.26
Concrete Curing	32,463.20	51,312.80	-$18,849.60
		Total	-$1,106,073.05

From this table it is shown that the cost of the Post-tensioning system costs about $1.1 million less than the existing two-way flat plate system. This could be because there was a smaller amount of cubic yards of concrete used in the post-tensioning system than there was in the two-way flat plate system.

Schedule Analysis

After the cost analysis of both floor systems was finished, a schedule was created for each system. *Microsoft Project* was used to create each schedule. Each schedule took into account the laying of formwork, reinforcing, placing of concrete and the curing of the concrete according to the daily output of the crews assigned from *RSMeans*. The post-tensioning system also had to take into account the tensioning of the tendons as well as the time it takes for the concrete to reach its strength to where the tendons can be stressed. It takes 5000 psi type III concrete approximately 3 days to reach a strength of 3000 psi, which is the strength needed according to ADAPT for the concrete to be ready to have the tendons tensioned. The equation used to find how many days it took the concrete to is $f'_{c(t)} = f'_{c(28)}[t/(2.3+0.92t)]$, on page 51 and 52 of *Reinforced Concrete: Mechanics and Design*. As seen on pages 120 and 121 of the appendix it took the post-tensioning system approximately 23 working days longer to construct than the existing two-way flat plate system. This is due to the fact that the tendons can't be tightened until 3 full days after the concrete has been poured.

Acoustics Breadth

There was one are of concern acoustically in the Baltimore Hilton Convention Center and that area was the pool and fitness room area. Beneath the pool and fitness rooms there are meeting and conference rooms. After looking at the pool area it was determined that the floor system provided enough sound isolation with help from the water in the pool so that the meeting rooms underneath weren't going to experience any harmful sound transfer from above. That left the fitness room as an area of concern. It was determined that there would be harmful sound transference from the fitness room down into the meeting rooms. The existing floor system is a 4.5 inch concrete slab on 2 inch metal decking. One solution to fix this is to change the floor to a floating floor. This would add a 1 inch air gap or insulation filled gap on top of the existing floor system, then on top of the gap 2 more inches of concrete would be added. This would increase the floor thickness to 9.5 inches but would increase the impact isolation class or IIC rating. With a higher IIC rating the amount of impact noise caused in the fitness room transferred to the structure would decrease, therefore decreasing the amount of sound transmitted down into the conference rooms allowing meetings to be uninterrupted by people lifting weights in the fitness room. Fig. 12 shows a cut-away section of the floating floor. Fig. 13 shows a detail of the existing floor system. Fig. 14 shows 3 different floor types on a Transmitted Impact Noise vs. Frequency graph. Fig. 15 shows how 4 different floor types how they compare to each other in sound-isolating effectiveness.

CONCLUSION

After redesigning the floor system of the Baltimore Hilton Convention Center Western Podium from a two-way flat plate system to a two-way post-tensioning system, it was determined that each floor slab would decrease in thickness except for the first floor and the third floor which increased by 2 inches and 1 inch respectively, and a total decrease in thickness of all the slabs of 31 inches. The majority of the decrease in slab thickness was located on the floors with the hotel rooms, each one of those floors decreased by 2 inches in thickness. The decrease in thickness increases the floor to ceiling height of the floors allowing for a more spacious feel in the hotel rooms and grand ballroom. The original column and beam layout and sizes were kept. With the decrease in weight of the floor slabs the overall building weight decreased therefore the existing foundation system is adequate for the new floor system. Also the decrease in weight reduced the buildings base shear and overturning moment due to seismic forces.

After determining the cost of the existing floor system and the post-tensioning floor system and determining the construction schedule for each it was found that that both floor systems have their own positives and negatives. The post-tensioning floor system was cheaper due to the decrease in the amount of concrete and mild reinforcing needed. The existing two-way flat plate system cost more but took less time to construct. The difference in cost was about $1.1 million and the difference in construction time was 22 working days. This saved the company money for construction costs but they would be charged more from the hotel due to the fact that the construction time is longer and the hotel is losing money for those days lost.

After looking at what the current floor systems were for the pool and fitness rooms it was determined that there wouldn't need to be any acoustical change for the floor system for the pool area; however, the floor system needed to be changed for the fitness room area. The floor was changed from a 4.5 inch slab on 2 inch metal decking to a floating floor system consisting of the 4.5 inch slab, 2 inch metal decking, a 1 inch air gap or gap filled with insulation, then a 2 inch slab to top it off.

① Seismic

Seismic Ground Motion Values

$S_S = 0.196$ $S_1 = 0.064$

Site Classification of Soil

C

S_{MS} and S_{M1} $F_a = 1.2$ $F_v = 1.7$

$S_{MS} = F_a S_S = 1.2(0.196) = .2352$

$S_{M1} = F_v S_1 = 1.7(0.064) = .1088$

S_{DS} and S_{D1}

$S_{DS} = \frac{2}{3} S_{MS} = \frac{2}{3}(.2352) = .1568$

$S_{D1} = \frac{2}{3} S_{M1} = \frac{2}{3}(.1088) = .0725$

Occupancy Category

II

Seismic Design Category

B

$T_S = \frac{S_{D1}}{S_{DS}} = \frac{0.0725}{0.1568} = .462\ s$

$T_a = C_t h_n^x = 0.016(203)^{0.9} = 1.9\ s = T$

$h_n = 203'$

$x = 0.9$ ← Concrete Moment-Resisting Frames

$C_t = 0.016$ ← Concrete Moment-Resisting Frames

$T < 3.5 T_S$

$1.9 < 3.5(.462)$

$1.9 < 1.62$ ∴ Use • Modal Response Spectrum
• Seismic Response History Procedures
• Equivalent Lateral Force Procedure
· Simplicity Reasons

② Seismic

$S_S = 0.196$

$S_1 = 0.064$

$S_{DS} = 0.1568$

$S_{D1} = 0.0725$

SDC = Category A

$R = 5$
$I = 1.0$
$T_a = 1.9_5 = T$
$C_u = 1.7$
$T_L = 8s$

$C_u T_a = 1.7(1.9) = 3.23 > 1.9 \quad \therefore T = 1.9_5$

$T = 1.9_5 < T_L = 8_s$

$$C_S = \frac{S_{DS}}{\left(\frac{R}{I}\right)} \leq \frac{S_{D1}}{T\left(\frac{R}{I}\right)}$$

$$\frac{.1568}{\left(\frac{5}{1}\right)} \leq \frac{0.0725}{(1.9)\left(\frac{5}{1}\right)}$$

$.031 \geq .008 \quad \therefore$ Use $.008 < .01 \quad \therefore$ Use $C_S = .01$

Weight $W = 100910.36^k$

Base Shear

$V = C_S W = .01(100910.36) = 1009.1^k$

$K = 2$

$$F_x = C_{vx} V = \frac{w_x h_x^k}{\sum_{i=1} w_i h_i^k} V$$

$$C_{vx} = \frac{w_x h_x^k}{\sum_{i=1} w_i h_i^k}$$

A. Design Parameters and Load Combinations

A.1 Project Design Parameters

Parameter	Value	Parameter	Value
Concrete		Minimum Cover at BOTTOM	1.00 in
F'c for BEAMS/SLABS	5000.00 psi	Post-tensioning	
For COLUMNS/WALLS	4000.00 psi	SYSTEM	UNBONDED
Ec for BEAMS/SLABS	4031.00 ksi	Fpu	270.00 ksi
For COLUMNS/WALLS	3605.00 ksi	Fse	175.00 ksi
CREEP factor	2.00	Strand area	0.153 in 2
CONCRETE WEIGHT	NORMAL	Min CGS from TOP	1.00 in
UNIT WEIGHT	150.00 pcf	Min CGS from BOT for interior spans	1.00 in
Tension stress limits / (f'c)1/2		Min CGS from BOT for exterior spans	1.75 in
At Top	6.000	Min average precompression	125.00 psi
At Bottom	6.000	Max spacing / slab depth	8.00
Compression stress limits / f'c		Analysis and design options	
At all locations	0.450	Structural system	TWO-WAY
Reinforcement		Moment of Inertia over support is	NOT INCREASED
Fy (Main bars)	60.00 ksi	Moments reduced to face of support	YES
Fy (Shear reinforcement)	60.00 ksi	Moment Redistribution	NO
Minimum Cover at TOP	1.00 in	DESIGN CODE SELECTED	ACI-318 (2005)

A.2 Load Combinations

Strength load combinations
1. 1.2 SW + 1.6 LL + 1.2 SDL + 1.6 X + 1 HYP

Service load combinations
Sustained Load
1. 1 SW + 0.3 LL + 1 SDL + 0.3 X + 1 PT
Total Load
3. 1 SW + 1 LL + 1 SDL + 1 X + 1 PT

Initial load combinations
1 SW + 0 LL + 0 SDL + 0 X + 1.15 PT
