Executive Summary

Technical Report 2 is a compilation and analysis of all the existing electrical systems within the Princeton Neuroscience & Psychology Complex. It explains how the distribution system works and breaks down all its components. It includes tables that address all the loads and switchgear within the building and at the end a single-line diagram ties everything together. The report begins with information from the utility company and then moves on to explain how the service entrance functions and how electricity is fed to all parts of the building.

Summary Description of Distribution System .

The Neuroscience & Psychology complex has an intricate electrical system design due to its large area and complicated laboratory spaces. The electricity supplied by the utility company to Princeton University's main distribution system enters the building through the northwest corner where there are two service entrances. These supply power to two double-ended substations with difference voltage systems. From here, power is distributed to the entire building through switchboards and distribution panels. There are approximately 65 pieces of switchgear equipment, 30 lighting panelboards, 65 receptacle panelboards, 25 transformers, 60 different luminaires, and 200 mechanical equipment (including plumbing and cafeteria equipment). Most of the lighting loads are part of the 480Y/277V system and the mechanical equipment is in the 208Y/120V system.

The emergency electricity is supplied by a generator on the exterior of the building that feeds three transfer switches and the fire pump. Special equipment includes Uninterrupted Power Supply and Transient Voltage Surge Suppressor systems. A very complex grounding system runs through the entire complex as well as a security and fire alarm system.

Utility Company Information

Name: Public Service Electric and Gas Company (PSEG)

Address: 15 West State Street, Trenton, New Jersey 08604

Website: <http://www.pseg.com/companies/pseandg/overview.jsp>

Basic Generation Service – Fixed Pricing (LPL-Large Power and Lighting Service)

October through May

On-peak: \$ 0.115242

Off-peak: \$ 0.077759

June through September

On-peak: \$ 0.130465

Off-peak: \$ 0.081768

Transmission

\$ 2.0251 kW of transmission obligation, applicable in all months

Service Entrance

Service entrance location and where it ties to campus: The service entrance is located on the northeast corner of the Neuroscience Building. There is an existing electric manhole very close by and from this (8) 5" conduits with 4 KV service run through a new electric manhole that feeds both service entry tap boxes each with two(2) sets of (3) #750+1/OG-5"C MV 105 and two(2) 5"RSC type stub outs. Each service entry tap box has four (4) sets of (3) #500-4"C MV 105 that feed two double-ended substations; one with 480/277V system and the other with a 208/120V system.

Description of equipment at service entrance location: Two (2) 5" rigid galvanized steel (RGS) conduits 9'-3" above the floor enter the building through the exterior concrete wall and connect to the service entry pull box which feeds the service entry tap box with four (4) 5" RGS conduits. Both service entry tap boxes are 60" x 60" and 36" wide and are 18" off the floor and have four (4) 4" RGS conduits coming out the top of the box.

Description of campus electrical system (metering, distribution, components): The utility company provides electricity to the campus at a main location. Each building is then fed through the campus distribution system. Princeton purchases primary service at 4160V. All service entrance components are provided and owned by University. Individual electric use of each building is monitored by university.

Voltage Systems .

Identification and description of general types of loads connected to each: There are two voltage systems within the complex: 480/277V and 208/120V. Each voltage system has its own double-ended substation fed from both service entrances for redundancy. The 480/277V system includes the following loads: lighting, AHUs, and mechanical. The 208/120V system feeds the following loads: receptacles, server racks, and VAV boxes (single-fed). Lighting that is on the dimmer panels (LPDs) is fed from transformers that reduce the 480/277 voltage system to 208/120. There is also a buck-boost transformer fed from a receptacle panel that feeds a coffee brewer that is rated 240V single-phase.

Emergency Power System .

Life safety loads are powered by the emergency generator when the normal power fails. On the northwestern end of the Neuroscience building, close to the service entrance, is a set of (8) 5" conduit that enters the building and feeds the emergency transformers, switchboard, and the fire pump. The 4160V emergency generator is located on the exterior of the building in a weather acoustic enclosure and it feeds the generator switchboard (4160V) in the emergency switchboard room. This then feeds the fire pump (480Y/277), the emergency switchboard (480Y/277) and a Camlock enclosure for a temporary generator connection in case the existing generator were to fail.

Location of Switchgear .

Locations of main gear and electrical closet: The main switchgear (two double-ended substations) is located in Level C/B on the northwestern corner of the Neuroscience building where the electricity from the utility enters in the Electrical Room C04ELR. There is another electrical room directly south of it, C05ELR, which has the emergency equipment and other switchgear.

Switchboards, distribution panel boards, motor control centers, transformers, generators, and transfer switches:

*RP-BC1 and RP-BC2 panel board schedules are missing from construction documents pages E9 because they are for the future and were not in the current contract.

Over-current Devices

Main switchgear/service entrance gear: Both substations are protected with fuses from each side. The first double-ended substation is protected first with 30E fuses and then with two 5000A main drawout type circuit breakers with a tie 5000A drawout type circuit breaker in the center. The second substation has the same set up but with 50E fuses and drawout circuit breakers sized at 4000A instead of 5000A. Transient voltage surge protectors (TVSS) are located immediately after the main circuit breakers for further protection. The substations feed main switchboards that are protected with drawout type circuit breakers as well.

Distribution panelboards: Common over-current devices for emergency switchgear includes drawout type circuit breakers. Non-emergency switchboards and distribution panels are protected with molded case circuit breakers of various frame and trip sizes ranging from 100AF/100AT to 1600AF/1600AT. Meters at main switchboards and substations measure power for further protection. Panels branching from these are also protected with molded case circuit breakers. Switchboard transformers are protected with main disconnects.

Branch circuit panelboards: Most receptacle panels have MCBS because they are fed from a distribution panel and some MLOs because they are fed directly from the busway that has a circuit breaker before reaching the panel. Most lighting panels have MLO and some MCB, the opposite applies for the receptacle ones. The main type of over current devices for branch panelboards and transformers are molded case circuit breakers with ranging frame and trip sizes.

Transformers

Most transformers have the same characteristics with varying sizes except for the transformers located in the service entry substations. They are mostly dry-type converting voltage from 480V, 3P, 3W to 208Y/120V, 3P, 4W with an 80% temperature rise and two 2.5% taps. There is a one buck-boost transformer that feeds a coffee brewer.

Individual Transformer Schedule:

Tag	Primary Voltage	Secondary Voltage	Size (KVA)	Type	Temp. Rise	Taps	Mounting	Remarks
T-MSWGR-C	4160V, 3P, 3W	208Y/120V, 3P, 4W	1.5/1.75 MVA (OA/FA)	liquid-filled	55 deg C	(4)3.0%	Pad mounted on floor

Grounding

There is a grounding electrode riser diagram that shows the grounding system in the complex. The main grounding busbar connects to two main cold water pipes, building steel, grounding ring, lightning protection system, substation transformer busbars, service entrance boxes, and electrical room busbars, including the emergency electrical room. The riser diagram is located in sheet E3-011 and is titled Electrical Ground Riser Diagram.

Special Equipment .

Uninterrupted Power Supply (UPS): There is one 100kVA Galaxy 500 UPS system and one 300kVA EPS 6000 Single Module UPS system both with a 208V input and output to PDU. They have 14-17 minutes of battery run time at full load. They include a bypass cabinet, three-phase UPS, and PDU suitable for multiple 3-pole 225AF circuit breakers.

Transient Voltage Surge Suppressor (TVSS): TVSS have an AIC rating of 200,000 amperes and provide overvoltage protection of >1800 cycles at 180% rated voltage to 0.7 ohm load. They have a field replaceable module with EMI Filtering. The peak single-impulse surge current rating is 259kA per mode/500kA per phase for service entrance TVSS. There are distribution panelboards/motor control center and branch panelboard suppressors. There are also suppressors for electronic-grade panelboard extensions.

Lighting Loads .

Typical lighting systems description | The general lighting of the Neuroscience & Psychology Complex includes two different systems. One was done by Fisher Marantz Stone and covers all the public areas and spaces that will be visible from the outside. The other lighting system was designed by Arup and it includes most laboratory space, classrooms, and offices.

The most common light source is fluorescent with the exception of some halogen downlights in important spaces, metal halide source in the light monitors, and certain LED highlights. Most of the laboratory spaces have linear fluorescent fixtures while most of the public spaces are illuminated with downlights. The most common fixture in the circulation spaces is the Louis Poulsen Cirkul fixtures in several sizes and mountings.

The public spaces have mostly uniform lighting with some emphasize on the perimeter wooden walls. All luminaires used have lamps with a CRI in the 80s and a CCT of 3000K. This warm color temperature is good to bring out the wooden tones and the 80 CRI is enough for good color rendering. The private spaces have mostly downlight. The exterior is lacking a lighting design with the exception on the fixtures in the canopy and vestibules.

Luminaire table | The following table includes all the luminaires in the Neuroscience & Psychology Complex beginning with those chosen by FMS (tag begins with letter F) followed by the Arup chosen ones.

Lighting Controls .

ASHRAE 90.1 2007 requires spaces to have at least one control device to independently control the general lighting. Classrooms and conference rooms need a control device that will turn off the lighting automatically 30 minutes after the occupants leave. For the rest of the spaces, the control device needs to be either activated manually or automatically. Each can control up to 10,000 sq.ft. and be capable of overriding time scheduled controls for no more than 4 hours.

The existing lighting controls includes dimmers, outdoor photoelectric switches, photoelectric sensors, indoor occupancy sensors, lighting contactors, and timeclocks all of which help reduce energy consumption. The emergency generator is on-site but the electricity for normal power comes from a utility company; it is not generated on-site. For example, in the main lecture hall, there will be one locally programmable wall station with timeclock capabilities. Three keypad controls with four preset scenes, off and lower/raise will be located at the entrances and at the lectern.

Mechanical and Other Loads

There are a total of nine air handling units that provide air conditioning to the entire complex with a total flow rate capacity of 137,000 cubic feet per minute (cfm). Seven are located in Level 3 (penthouse MER) and serve the following areas: south variable air volume (VAV) system, laboratories, Neuroscience building chilled beams, and north VAV system. The remaining two are located in level C/B (MER) serve the following areas: Psychology Building chilled beams, and Lecture Hall. The air handling units include a supply fan, preheat coil, cooling coil, heating coil, return fan, glycol hr (heat recovery) coil, humidifier, pre-filter, and a final filter.

Labs are required to have 100% outside air. The rest of the spaces have return air or heat recovery wheels. There are 25 fan coil units from International Environmental (IEC). Variable air volume boxes capacities range from 0-4500 cfm. Their sizes range from 5"-16" diameters and up to 24x16 rectangular areas. There are a total of four chilled beam types, three hot water cabinet/unit heaters, and 13 chillers. The mechanical system also includes three radiators with a total capacity of 1400 BTUH/LF.

Service Entrance Size

The service entrance size can be calculated several ways depending on the construction phase the project is on. Following are the calculations done for the Conceptual/Schematic, Design Development, and Working Drawings Phases.

Step 1 – Conceptual/Schematic Phases – Load per Square Foot

Building Type: College Building - Lab = 30VA/sq.ft.

Square footage of Princeton Neuroscience & Psychology Complex = 248,000 sq.ft.

Total Conceptual Loading = 7,440,000VA = **7,440 KVA**

Step 2 – Design Development – NEC Loading

Lighting | NEC Table 220.12 General Lighting Loads by Occupancy

Type of Occupancy: Schools -> Unit Load = 3VA/sq.ft.

3VA/sq.ft. x 248,000 *1.25 = 930,000VA = **930 KVA**

NEC Table 220.42 Lighting Load Demand Factors

Type of Occupancy: All Others -> Demand Factor = 100%

930KVA x 100% = **930 KVA**

Receptacles | 1VA/sq.ft. x 248,000sq.ft. = 248,000VA

NEC Table 220.44 Demand Factor for Receptacles

10KVA x 100% + 238KVA x 50% = **129 KVA**

Mechanical, Plumbing, and Other | Table 2 – Demand Loading Information

HVAC Equipment: Electric Heating = 15VA/sq.ft.

15VA/sq.ft. x 248,000 sq.ft. = 3,720,000VA = **3,720 KVA**

HVAC Equipment: Cooling = 8VA/sq.ft.

8VA/sq.ft. x 248,000 sq.ft. = 1,984,000VA = **1,984 KVA**

Kitchen Equipment: 600sq.ft. x 20VA/sq.ft. = 12000VA = **12 KVA**

Architectural: 6 Elevators: 6 x 50kw = **300 KVA**

Total NEC Loading = 8005 KVA

Step 3 – Working Drawings – Actual Loading

Environmental Stewardship Design .

All new construction in Princeton University is expected to comply with LEED Silver Certification. They will comply with MR 5.1 and 5.2 Regional Materials, EA 6 Green Power, part of EA 1 Optimized Energy Performance but not with EA 2 On-site Renewable Energy, EQ 8 Daylight and Views, and SS 8 Light Pollution Reduction.

The existing lighting controls includes dimmers, outdoor photoelectric switches, photoelectric sensors, indoor occupancy sensors, lighting contactors, and timeclocks all of which help reduce energy consumption. The emergency generator is on-site but the electricity for normal power comes from a utility company; it is not generated on-site.

Design Issues .

Information from Deanna Schmidt, Senior Electrical Engineer at Arup:

Emergency power loads | In designing any system one must be cognizant of the loads and the size of the distribution, utility or generator to support those loads. At Neuroscience it was a program directive to provide generator power backup to the animal watering, feeding and bedding systems, as well as to the HVAC that serves those animal rooms. But what this did was consume a lot of the capacity of the generator. The University wanted to keep the generator size to 1500kW and so one design issue was determining what other than the above described would be carried by the generator. The most obvious example of this design issue is on sheet E3-003. UPS-N is not connected to the generator (see left side) but UPS-SB is connected (right side). This means the users will connect their most critical server room equipment to the panels fed from UPS-SB, while equipment connected to UPS-N will have battery backup but not generator backup.

Lighting Power/Energy Use | In pursuit of LEED Silver equivalent, design issues were encountered in being better than ASHRAE 90.1 Lighting Power Density/Energy Use values.

High Ceilings | The architectural design of Neuroscience focuses on high ceilings and skylights throughout the facility. We have modeled this facility using 3D CAD software. It became apparent during design that all of the building systems were not going to be able to route to the rooms they served as directly as would be preferred. In this way, the lengths of conductors were impacted which factors into, especially, the voltage drop calculation and therefore the size of the conductor(s).

Communication Systems .

Fire Alarm System | To ensure the safety of all the occupants of the complex, a fire alarm alerts the occupants and the fire department in case of an emergency. The fire system includes manual fire alarm pull stations, bells, horns, wall and ceiling-mounted speakers, visual strobe lights, heat detectors, smoke detectors, flow and tamper switches, break glass stations, telephone jack for use by fire department, monitor/control modules, combination magnetic door holders and smoke detectors furnished with door hardware, control panels, and smoke detectors.

Security System | Because of all the special laboratory equipment located in this building for experimentation and research, an intricate security system is required to protect all of it. The security system includes access controls, door contacts, electrical locks, transfer hinges, intercoms, CCTV monitors, and network video recorders. All the parts of the system stem out from the Security Room (B08) and get distributed through all floors up to level 4.

- GENERAL NOTES:**
1. THE SWITCHGEAR LINEUP DESIGN INDICATED HERE IS DIAGRAMMATIC FOR SPACE PLANNING PURPOSES ONLY. CONTRACTOR IS RESPONSIBLE FOR EXACT LAYOUT AND ALL INTERNAL WIRE/BUS SIZING AND ROUTING.
 2. INTERNAL SWITCHGEAR WIRE AND BUS TO BE SIZED BASED ON THE FORCED AIR RATING INDICATED FOR THE TRANSFORMERS.
 3. SUBSTATION LIQUID FILLED TRANSFORMERS SHALL BE ISOLATED.
 4. PROVIDE MIMC BUS ON SWITCHGEAR.
 5. ALL FEEDERS ON THE PRIMARY SIDE SHALL BE 5/8KV RATED.
 6. ALL TAPS SHALL NOT EXCEED 10 FEET.
 7. ALL MSWGR-A, B, C AND D BREAKERS SHALL BE ELECTRONIC ADJUSTABLE TRIP, 100% RATED.
 8. PROVIDE GROUP FAULT PROTECTION AT ALL MAINS, TIES AND FEEDERS AS MANDATED BY B, C AND D.
 9. SUBSTATION LIQUID FILLED TRANSFORMERS SHALL BE PROVIDED WITH FAN COOLING.
 10. PROVIDE UL LISTED POWER TERMINAL BLOCKS FOR TERMINATING CABLES.
 11. ENSURE AND INSTALL THE ELECTRICAL ION 7550 METERS AS INDICATED ON THIS DRAWING WITH CAMPUS MONITORING POINTS CONNECTED TO COLLEGE LAN SYSTEM. REFER TO COMMUNICATION DRAWINGS FOR LOCATION OF DEDICATED IT OUTLETS ABOVE THE SWITCHGEAR LINEUP. INCLUDE ALL CONNECTIONS REQUIRED FOR SYSTEM TO BE MONITORED FROM MAIN CAMPUS CONTROL CENTER IN THE MACMILLIAN BUILDING, USING THE SCADA SYSTEM.

REFERENCE NOTES

- [1] AUXILIARY POSITION SWITCH ON SKV INTERRUPTER SWITCH. POSITION SWITCH IS CLOSED WHEN MAIN SWITCH IS CLOSED.
- [2] GANGED TRANSFORMER ALARM CONTACT. CONTACT CLOSED ON HIGH TEMP, LOW LEVEL, ETC.
- [3] THREE VT'S WITH 120 VAC SECONDARIES.
- [4] POWER MEASUREMENT ION 7550 METER WITH TEST SWITCH. METER TO ACCEPT UP TO EIGHT DIGITAL INPUTS (DI).
- [5] THREE CT'S WITH 5 AMP SECONDARIES AND MULTI-RATIO TAPS. WIRE ALL TAPS OUT TO ACCESSIBLE TERMINATION BLOCKS.
- [6] AUXILIARY CONTACT ON POWER CIRCUIT BREAKER. CONTACT CLOSED WHEN CIRCUIT BREAKER IS CLOSED.
- [7] TVSS ALARM CONTACT. CONTACT IS CLOSED WHEN TVSS IS IN ALARM.
- [8] KWH PULSE OUTPUT TO NEAREST DDC CONTROL CABINET.

Lighting

74116 - GEMH39-MC-120

GE HID UltraMax™ eHID Electronic Low Frequency Ballast

- Light-weight, Low Profile Housing
- Superior low frequency square wave frequency design maximizes performance and life of ceramic metal halide lamps.
- Ultra slim can size for fixture design flexibility

GENERAL CHARACTERISTICS

Application	1- 39W M130 120V Micro Electronic HID
Category	High Intensity Discharge
Ballast Type	Electronic - Low Frequency
Line Voltage Regulation (+/-)	10 %
Ambient Temperature (MAX)	55 °C(13 °C)
Case Temperature	80 °C(176 °F)
Ballast Factor	Normal-High (1.0)
Sound Rating	A (20-24 decibels)
Enclosure Type	Plastic
Distance to Lamp	8 ft
Additional Info	End of Life Protection (EOL)/Thermally protected

PRODUCT INFORMATION

Product Code	74116
Description	GEMH39-MC-120
Standard Package	Case
Standard Package GTIN	10043168741160
Standard Package Quantity	10
Sales Unit	Case
No Of Items Per Sales Unit	1
No Of Items Per Standard	10
Package	
UPC	043168741163

DIMENSIONS

Case dimensions			
Length (L)	3.0 in(75.95 mm)		
Width (W)	1.3 in(33.02 mm)		
Height (H)	1.1 in(27.94 mm)		
Mounting dimensions			
Weight	0.38 lb		
Exit Type	Side		
Remote Mounting Distance to Lamp	8 ft		
Remote Mounting Wire Gauge	18 AWG		
Lead lengths	Qty	Exit	Length (\pm 1 in.)
White	1	Left	6 (152mm)
Red	1	Left	6 (152mm)
Brown	1	Left	6 (152mm)
Black	1	Left	6 (152mm)

ELECTRICAL CHARACTERISTICS

Lamp Operating Frequency 133 Hz

SAFETY & PERFORMANCE

- cUL Listed
- UL Listed
- RoHS Compliant
- ANSI - C82.14-2006
- UL94V0 Flame Retardant
- Short Circuit Protection
- Inherent Thermal Protection

SPECIFICATIONS BY LAMP & LINE VOLTAGE

CAUTIONS & WARNINGS

Caution

- Do not connect Brown or Red wires to ground
- Not designed for recessed applications.

NOTES

- Not designed for recessed applications.
- 150C rated lead wires
- Short Circuit Protection
- Do not connect Brown or Red wires to ground

WARRANTY INFORMATION

GE Lighting warrants to the purchaser that each ballast will be free from defects in material or workmanship for period as defined in the attached documents from the date of manufacture when properly installed and under normal conditions of use.

Oct 24, 2010 3:11:44 PM

ecomagination™

CAUTIONS & WARNINGS

R- WARNING: This lamp can cause serious skin burn and eye inflammation from shortwave ultraviolet radiation if outer envelope of the lamp is broken or punctured, and the arc tube continues to operate. Do not use where people will remain for more than a few minutes unless adequate shielding or other safety precautions are used. Certain types of lamps that will automatically extinguish when the outer envelope is broken or punctured are commercially available. Visit the FDA website for more information: <http://www.fda.gov/cdrh/radhealth/products/urburns.html>

Caution

- Lamp may shatter and cause injury if broken
 - Do not use excessive force when installing lamp.
 - Do not use lamp if outer glass is scratched or broken.

Warning

- Risk of Electric Shock
 - Do not use where directly exposed to water or outdoors without an enclosed fixture.
 - Turn power off before inspection, installation or removal.

Risk of Fire

- Keep combustible materials away from lamp.
- Use fused or thermally protected ballast - see instructions.
- Use in fixture rated for this product.

Risk of Burn

- Allow lamp to cool before handling.
- Do not turn on lamp until fully installed.

A damaged lamp emits UV radiation which may cause eye/skin injury

- Turn power off if glass bulb is broken. Remove and dispose of lamp.
- Unexpected lamp rupture may cause injury, fire, or property damage
 - Do not exceed rated voltage.
 - Do not turn on lamp until fully installed.
 - Do not use beyond rated life.
 - Do not use lamp if outer glass is scratched or broken.
 - Do not use where directly exposed to water or outdoors without an enclosed fixture.
 - Operate lamp only in specified position.
 - Use in enclosed fixture rated for this product.
 - Use only properly rated ballast.

NOTES

- Rated life is 15,000 hours on magnetic ballasts.

GENERAL CHARACTERISTICS

Lamp Type	High Intensity Discharge - Ceramic Metal Halide
Bulb	T4.5
Base	Bi-Pin (G8.5)
Wattage	39
Rated Life	16500 hrs
Bulb Material	Quartz
Lamp Enclosure Type (LET)	Enclosed fixtures only
LEED-EB MR Credit	125 picograms Hg per mean lumen hour
Additional Info	UV control

PHOTOMETRIC CHARACTERISTICS

Initial Lumens	3400
Mean Lumens	2300
Nominal Initial Lumens per Watt	87
Color Temperature	3000 K
Color Rendering Index (CRI)	84

ELECTRICAL CHARACTERISTICS

Burn Position	Universal burning position
Warm Up Time to 90%	2 min
Warm Up Time to 90% (MAX)	2 min
Hot Restart Time to 90% (MIN)	10 min
Hot Restart Time to 90% (MAX)	15 min

DIMENSIONS

Maximum Overall Length (MOL)	3.37 cm
Bulb Diameter (DIA)	0.563 cm
Bulb Diameter (DIA) (MAX)	0.563 cm
Light Center Length (LCL)	2 cm
