#### **Executive Summary**

This technical assignment has been put together to further familiarize the reader with the Turnberry Tower Arlington Project in Arlington, Virginia. In this report you will find a detailed project schedule, different site plans used during the construction process, a detailed structural systems estimate for the post-tension concrete structure, and the general conditions estimate used to construct the building. Lastly, a summary from the 2008 PACE Conference is given.

Excavation of the site started on July 2<sup>nd</sup>, 2007 and the project has a substantial completion date set for August 30<sup>th</sup>, 2009. Counting preconstruction services, the project will take a little over 3 years to complete. The project's schedule was put together utilizing a Short Interval Production Schedule (SIPS) for the construction of the tower levels. With the highly repetitive amount of work from level to level, this is a great example of when SIPS can be used to make a job run more efficiently.

This project had 3 different phases of construction which led to the need for 3 different site plans. During excavation most of the equipment was located down in the hole for digging purposes. The limited space around the hole was left open or used for the storage of materials. The next phase consisted of the erection of the garage, which, logistically, was the most complicated phase. The garage footprint comprises most of the site. This left little space for site offices and material and equipment storage. With limited space in a downtown environment, careful planning was needed to ensure this construction went smoothly. The last phase to be completed is the tower erection. This occurs after the completion of the garage, so the garage is used as storage and office space for the subcontractors. The SIPS schedule also creates lead time for the erection of the post-tension decks and the rough-in on the floors. That gives the subcontractors the ability to stock their materials on the floor where it is needed prior to beginning their activities.

A detailed structural systems estimate was created to see how much the post-tension concrete structural system will cost for this project. All of the materials were quantified in amounts and given a unit price. This price was then combined with the average cost of labor and equipment. The total cost for the structural system was found to be \$20.6 million which equates to \$27.55 per square foot.

A general conditions estimate was created based on numbers and items obtained from the general contractor. From that percentages and cost per units were extrapolated. Some of the items that made up the estimate included staff, site work, temporary utilities, site office, and insurance. The total cost for general conditions for this project are \$13.5 million.

On October 16<sup>th</sup>, 2008, the PACE Conference took place at Penn State University. Different topics discussed included the creation a mentoring program, energy and the environment, and a group discussion with an industry panel and a student panel. Parts from each discussion will aid in the creation of a thesis topic including the rising price of materials and the potential shift in companies to different types of work all because of the economic crisis that is occurring.

#### I. Detailed Project Schedule

The schedule that has been created is based on the phases of construction for Turnberry Tower Arlington. The first construction phase includes the erection of the 6 story underground parking garage and the second construction phase includes the erection of the 26 story residential tower. The detailed scheduled can be found in **Appendix A**. Below in *Table I.I* you can find the abridged version of the detailed schedule which includes only the summary activities.

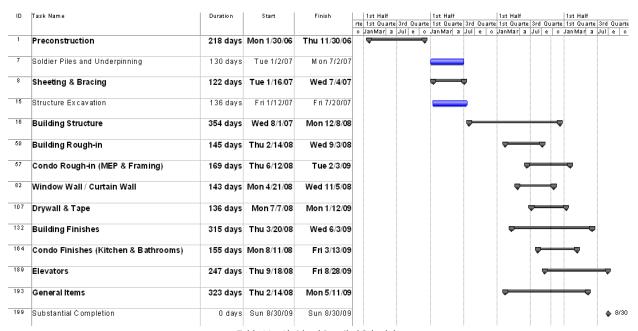

Table I.I – Abridged Detailed Schedule

From the above schedule, some of the key completion dates for Turnberry Tower Arlington include:

Structure Excavation

Building Structure Erection

Condo Rough-in (MEP & Framing)

Window Wall / Curtain Wall

Building Finishes

Elevators

July 2<sup>nd</sup>, 2007

December 8<sup>th</sup>, 2008

February 3<sup>rd</sup>, 2009

November 5<sup>th</sup>, 2008

June 3<sup>rd</sup>, 2009

August 28<sup>th</sup>, 2009

Substantial Completion August 30<sup>th</sup>, 2009

The schedule that has been created shows the Short Interval Production Schedule (SIPS) that is being used on this project. Building structure erection, rough-in, window wall / curtain wall, drywall, and finishes are broken down according to each level. Both the garage and the tower levels were grouped together where the same type of work would be taking place (concrete placement) and separated where different work would be occurring (different types of finishing). A copy of the SIPS being used on this job that was utilized to create the detailed schedule can be found in **Appendix B**. Durations and start dates for the activities in the detailed schedule were obtained from the general contractor.

#### **II. Site Layout Planning**

During construction of Turnberry Tower Arlington, three different site plans were utilized to help maximize efficiency of construction. The three different phases included excavation, garage erection, and tower erection. A copy of the utility site plan can be found in **Appendix C**.

#### Excavation

This phase of the project provides the least cluttered site plan. There is 1 equipment trailer on site along with 2 dumpsters (one for concrete and one for garbage for LEED points), toilets, and material storage. The material storage on the west side of the site is for tie-back materials. During this phase the temporary electric shed and covered walkways that are to be used for the whole project were constructed. The access ramp for excavation trucks and equipment is off of Ft. Myer Drive on the east side of the site. See page 6 for a copy of the Excavation Site Plan. *Figure II.I* shows a view of the site looking northeast from Key Boulevard.

Figure II.I – Picture from Key Blvd.

#### **Garage Erection**

This phase of the project was logistically the toughest because of the limited space in a downtown environment. The site was mainly used for construction as you can see from the site plan on page 7. The garage footprint takes up most of the site which made it difficult to have on site job offices, material storage, dumpsters, and worker access to the pit. To ease this congestion, the general contractor along with members of the project team, rented out space in an adjacent office building for the excavation and garage erection phases. Careful planning was needed to erect the tower cranes with all of the needed materials already on site and the covered walkway already being constructed. Concrete deliveries were taken from both Ft. Myer Drive and Nash Street. Dumpsters were emptied from the site fence on the corner of Key Boulevard and Nash Street.

#### **Tower Erection**

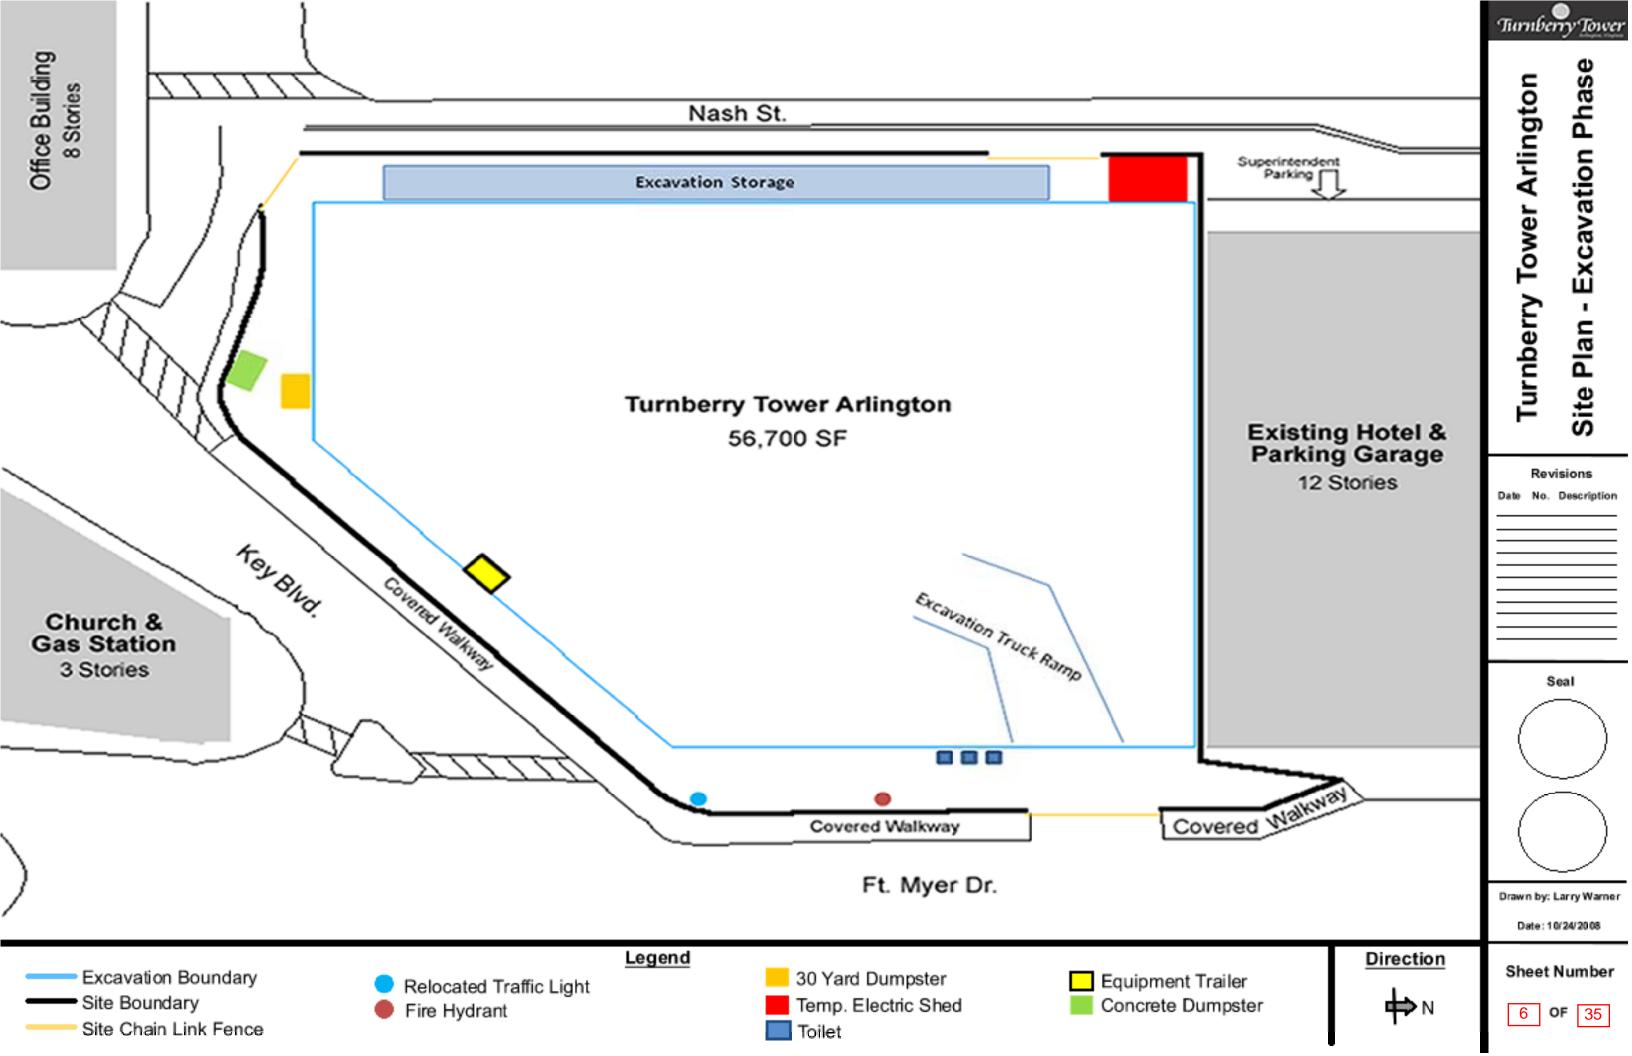

This phase proved to be the easiest with site logistics planning as you can from the Tower Erection Site Plan on page 8. You can see that the footprint of the tower is significantly smaller than that of the parking garage. Also, with the parking garage finished, space in the garage was used as the site offices for the subcontractors and the general contractor. This helped to free up the rest of the site so it could be used for material staging areas. Figure II.II shows the amount of free space in the lobby level for storage.

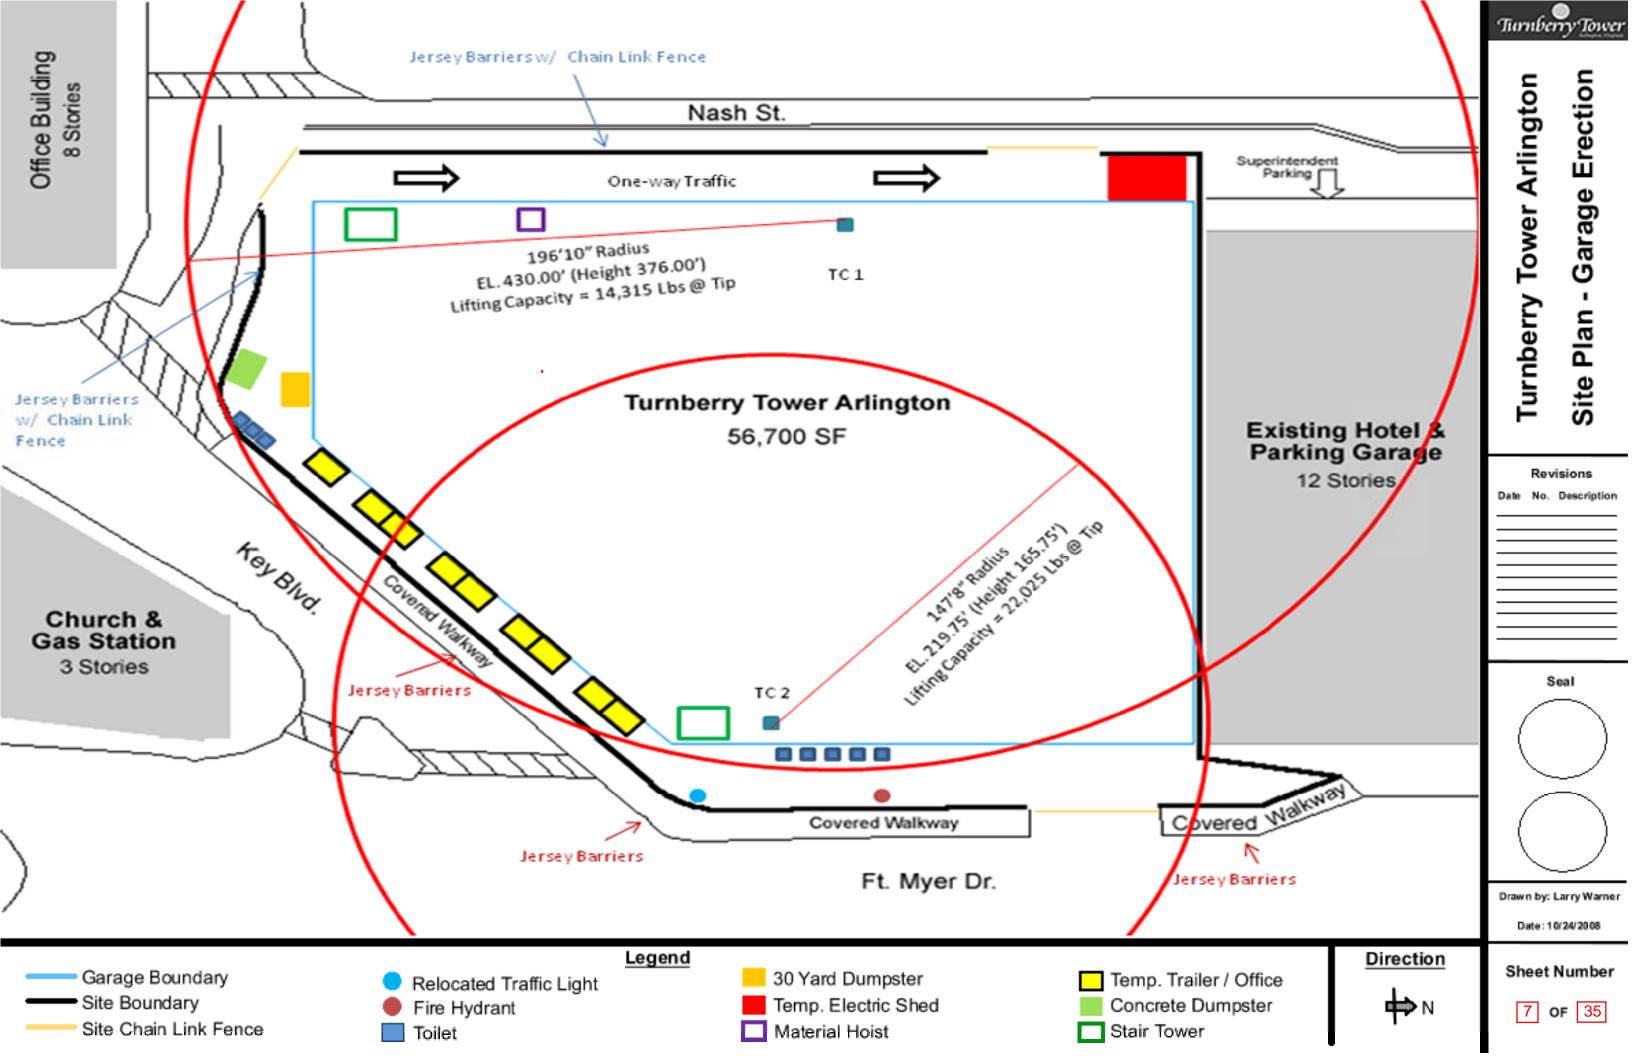

The parking levels were used as storage areas including for the nearly 2 miles of elevator rail that will be installed in the building. Toilets are located on the lobby level near the entrance to the parking garage. The trash chute is on the west side of the site and is located where the trash removal trucks will have easy access to pick up the 30 yard dumpsters via the site access fence. This west site access will also be used for unloading deliveries. This access is the reason that the loading dock and the material hoists are located where they are on the northwest side of the project. This area is big enough that an 18 wheeled tractor trailer is able to unload its' cargo.

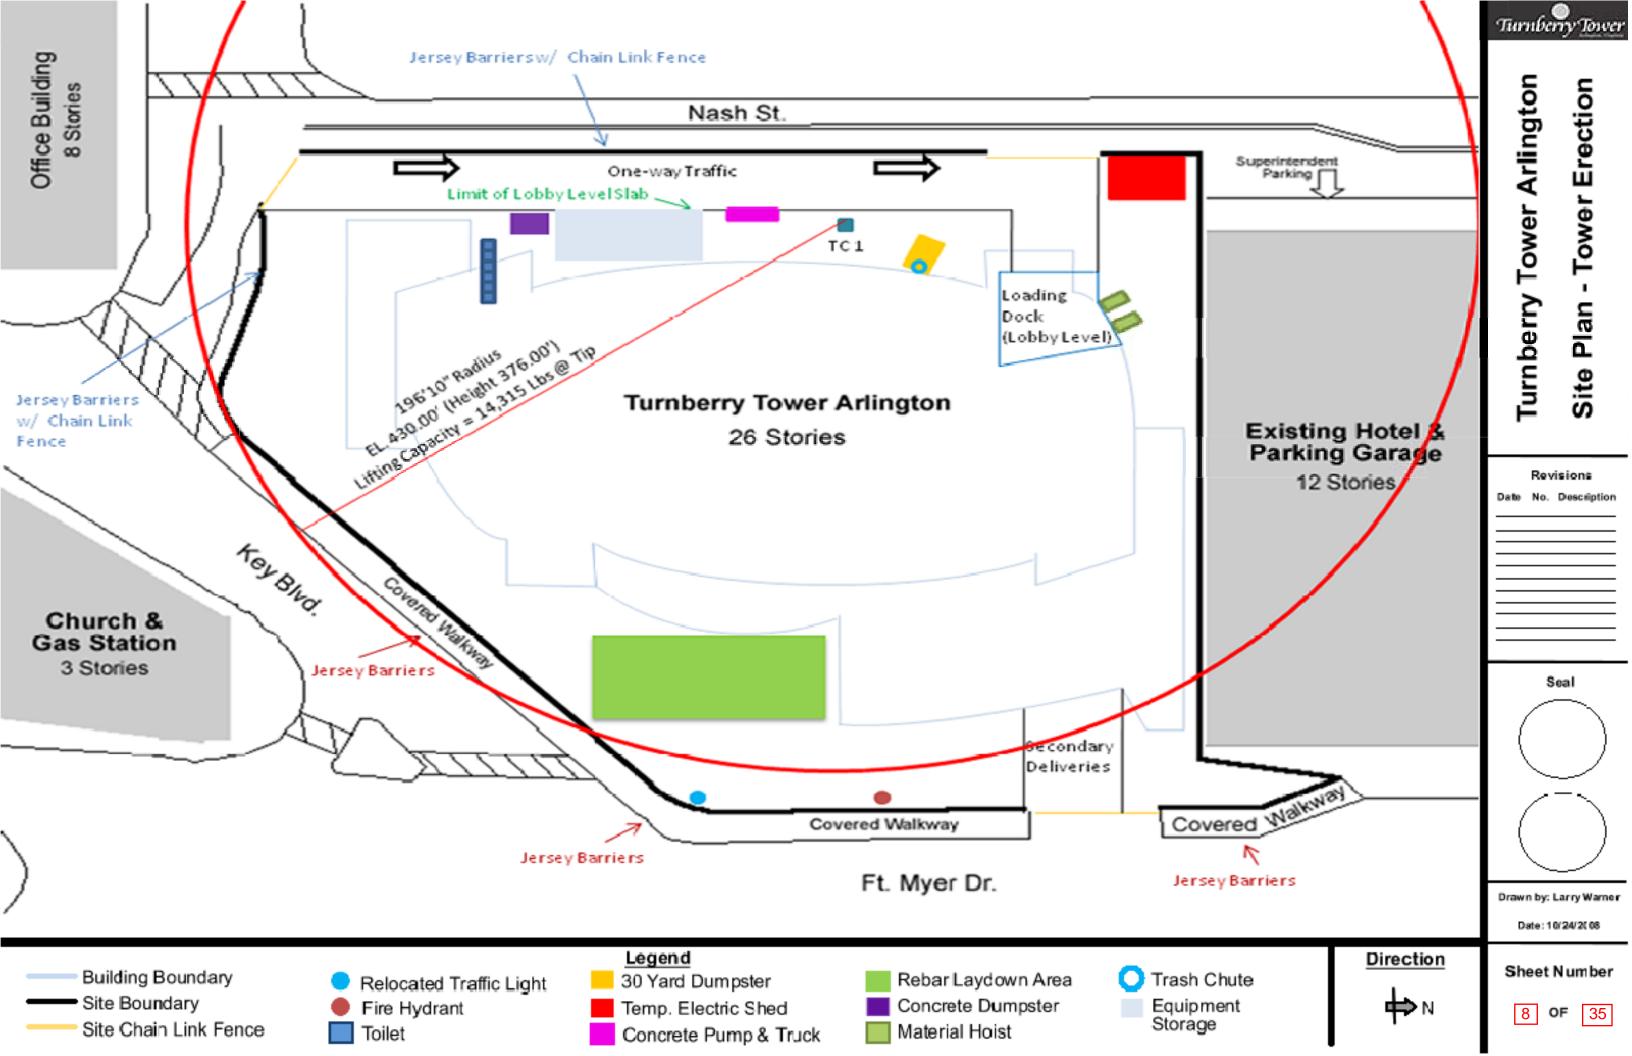

The biggest change from the garage erection to the tower erection is the removal of tower crane 2 which frees up most of the east side of the site. It is important to notice that tower crane 1 does not reach the far west side of the building footprint. The only section that the crane cannot reach is a 3 story clock tower. The crane is not needed for its construction, which is being done by the miscellaneous metal subcontractor.

Figure II.II - Lobby Level during Tower Erection

#### **III. Detailed Structural Systems Estimate**

Turnberry Tower Arlington's primary structural system is post-tension concrete for the tower level and cast in place concrete for the parking levels. A structural system estimate was created from takeoff notes for the entire structural system of the building. Below in *Table III.I through Table III.III* are the results from the estimate. All takeoff notes can be found in **Appendix D**.

Total M	laterial Cost	
Item	Amount	<b>Total Cost</b>
Concrete	37,351 CY	\$4,668,875
Reinforcing Steel	3071 Tons	\$3,071,000
Miscellaneous Items		\$2,481,385
Total		\$10,221,260
Total per CY		\$273.65

Table III.I – Total Material Cost

Average L	abor and Equip	ment	
Description	Labor	Equipment	Unit
Footings	\$54.50	\$0.33	CY
Columns	\$435.00	\$42.50	CY
Slab on Grade	\$55.00	\$0.41	CY
Slabs	\$207.00	\$19.60	CY
Beams	\$490.00	\$48.50	CY
Shear Walls	\$430.00	\$42.50	CY
Curbs, Pads, Toppings	\$129.00	\$1.78	CY
Average per CY	\$257.21	\$22.23	CY

Table III.II – Average Labor and Equipment Costs

Construction Cost of	Concret	te Sys	tem for 1	Γurnberry	y Tower Arl	ington
Description	Qty	Unit	Material	Labor	Equipment	Total Cost
Cast In Place Concrete including placing and stripping formwork,	37351	CY	\$273.65	\$257.21	\$22.23	\$20,658,837
placing rebar, placing concrete, and finishing concrete				TOTAL	\$27.55	per SF

Table III.III – Construction Cost of Structural System

R.S. Means 2008 Building Construction was used to find the average price of labor and materials that were needed to create this construction estimate. Prices for concrete per cubic yard, rebar per ton, and PT cable cost per pound were obtained directly from the subcontractor. Prices that were given include:

Concrete = \$125 / cubic yard

Rebar = \$1000 / ton

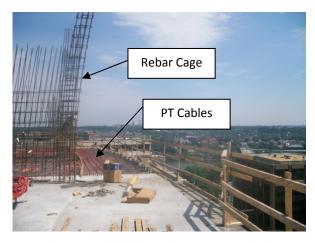

PT Cable = \$1.15 / pound

These numbers were used with the takeoff values to obtain the material cost for the structural system which totaled \$10,221,260. When this number is divided by the number of cubic yards of concrete for this project the total is \$273.65 per cubic yard. This number was added to the average cost of labor (\$257.21 per cubic yard) and equipment (\$22.23 per cubic yard) and the total cost of \$20,658,837 was obtained for the construction of the concrete structural system. This number, when divided by the projects 750,000 square feet, yields \$27.55 per square foot (as seen in *Table III.III*).

The price of \$27.55 is a bit high for concrete construction. Normal construction averages \$25 per square foot. Some of the reasons that this estimate may be high include:

- 1. Rise in prices for steel and rebar
- 2. Transportation costs to get the material to site
- 3. Cost of the automatic climbing formwork and flying formwork to gain time on the schedule
- 4. Post-tension steel cables
- 5. Much larger waste factor was calculated than was necessary

Figure III.I shows a typical tower level with rebar cages for shear walls and columns, part of a concrete deck poured, and exposed PT cables laid out and ready for a concrete pour. Figure III.II shows the use of the Automatic Climbing System (ACS) for the core of the building.

Figure III.II - ACS Formwork for Core

#### **IV. General Conditions Estimate**

A general conditions estimate was created by the general contractor for the Turnberry Tower Arlington project. Because of the complexity of this project and the owner's expectation to pay close attention to cost, schedule, and quality, the general conditions are very specific. **Appendix E** has the complete breakdown of the general conditions estimate including the prices, percentages, units, unit costs, and cost per month. Some of the numbers have been slightly modified based on the request of the general contractor. Table IV.I below shows the main breakdown of the general conditions for this project.

General (	Conditions	
Item	Cost	% of GC
Staff	\$5,881,000	43.62%
Site Work	\$1,193,000	8.85%
Temporary Utilities	\$1,300,000	9.64%
Site Office & Job Needs	\$985,500	7.31%
Site Security	\$491,000	3.64%
Contracts	\$77,000	0.57%
Insurance	\$3,555,000	26.37%
TOTAL	\$13,482,500	100%

Table IV.I - General Conditions Breakdown

The final estimate for the general conditions totals \$13.5 million which is approximately 9% of the \$150 million total project cost. There is a Contractor Controlled Insurance Policy (CCIP) for this job but there is still a need for the umbrella liability, general liability, and workers compensation insurance policies to be added to make the insurance complete. Although the general contractor's site offices will be housed inside of the future café of the building, a space needed to be rented out until such time that the café area was complete and enclosed by the window walls to make the space watertight. This explains why the cost of the site office is not lower than one would anticipate.

Like most general conditions on any given project, a majority goes towards paying the staff of the general contractor. This project is staffed so most of the people on the project team are on the project for the entire duration. Below in *Table IV.II* is the project staffing plan

#### V. PACE Seminar 2008 - Critical Industry Issues

#### Session 1 – Mentoring

During this session students and industry members discussed what would be the best way to set up a mentoring program for the Architectural Engineering Department. I was able to work with Mark Konchar from Balfour Beatty Construction. During our discussion the group agreed some of the necessities for this program would include having this program separate for classes and not including it as part of a grade for the student. It was discussed that it would be important for the mentor be unbiased and not use this program as a recruiting tool.

I was surprised from the number of industry members who agreed that this program should stay separate from a recruiting technique. All agreed that if this became a recruiting type of program then it would not benefit the students and the program might not last. A majority of the students want to see the program create relationships that do not incorporate having to get an internship or a job. If this program is done right, it could benefit both parties. The students would have help with career decisions and someone they can look up to, and the mentors will have a direct link to the Architectural Engineering Department which will help them stay abreast on current issues and research.

#### Session 2 - Energy and the Environment

This session was the most informative of the day. Topics that were discussed included the state of the economy and how that impacts different sectors of construction. Also discussed were employment and benefits in different companies and how sustainable construction can effect construction overall when money is tight. The general opinion of industry members is for students to find a company that would like to make an investment on its' employees. You also should look long term and someone is who trying to grow at a constant rate.

Some of the surprising discussions came when industry members were talking about how some developers are enjoying the tough times that our economy is going though. Although there much more preconstruction going during times like these, there are developers buying properties at a very cheap price. It is also a good time for developers to pick up "salvage projects" at a reduced price. Some contractors enjoy projects like this because the bonding company is responsible for paying them and not the owner who may become bankrupt at a time like this.

#### Session 3 – Industry Panel

Six members from the industry sat up on a panel and answered questions from students. Questions ranged from asking about different construction techniques, technology and how it will be implemented in the construction field, and how important new hires are to companies.

One answer that surprised me the most pertained to new hires and their importance to a company. It was said that some companies look to their new staff to become the experts in new types of construction techniques and processes. Most of these candidates have just finished college and are used to working with newer programs and computers. This will enable them to teach this technology to others in the company as well.

#### Session 4 – Student Panel

For this exercise I was fortunate enough to be able to sit on this panel. This discussion was about distractions and how they help or hurt our productivity and ability to work. Most of the questions asked were very good and made all of us on the panel think hard and relate the answers to past experiences.

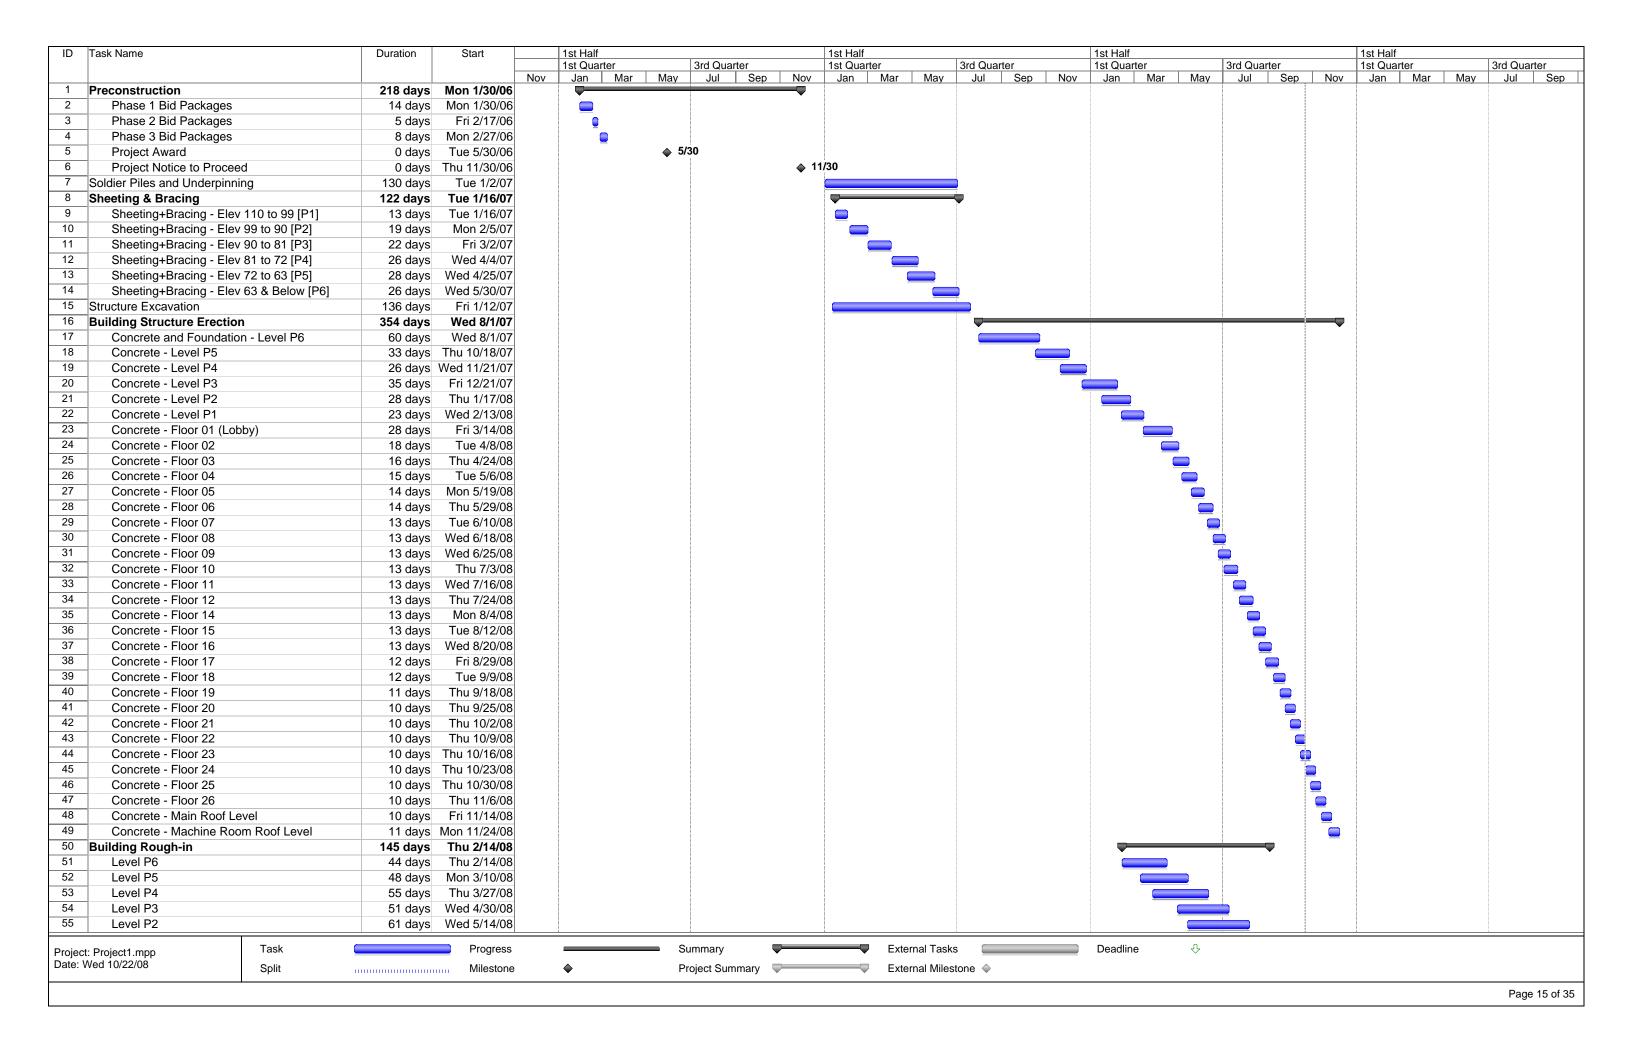

The one thing that shocked me was how different everyone is that was on the panel with extracurricular activities that keep us all busy. When we are all in class and working on school work, we seem to have the same things in common. That is why many people, especially in the construction management option, seem to be close friends. When you put that aside, it seemed that everyone was almost completely different with the activities we all do. Those differences coupled with our values will dictate what path we take in our careers.

#### <u>Issues Pertaining To My Project</u>

Some of the issues that will help my project will be the prefabrication of different materials and how that can help the overall cost and schedule. Most MEP units do come partially assembled but it would be interesting to see more common items assembled before they were delivered. Another issue that can be looked at closely is technology from other countries. For some of the systems in my building including MEP, it would interesting to see if there are other systems out there that would be more efficient and save money than the ones currently being used.

SV SV = SURVEYOR FOR PRIMARY CONTROL FL FL = FLOOR LAYOUT, INSTALL TOP TRACK

WL WL = WINDOW LAYOUT

H1 H1 = DUCT WORKS ROUGH-INS, HVAC/ PLUMBING ROUGH-INS

WD WD = INSTALL WINDOW WALLS, CURTAIN WALL
HR HR = INSTALL BALCONY RAILING/ DIVIDERS
S1 S1 = FRAME, BLOCKING, DOOR FRAME CORR.

H2 H3 = SET TUBS

FP FP = SPRINKLER ROUGH-IN UNITS/CORRIDOR

H3 H3 = PLUMBING WALL ROUGH-INS, SET SHOWER DIVERTERS
E2 E2 = ELECTRICAL WALL RI, CONTROL WIRING TO FCU STAT

E2 = ELECTRICAL WALL RI, CONTROL WIRING TO HP STAT

I = INSPECTIONS, WALL INSULATION, INSULATE PLMB DW RISERS.

DT DT = DRYWALL & TAPE; 3RD WEEK WINDOW TRIMS
D1 D1 = PRIME PAINT WALLS/ UNIT CEILINGS/ DOORS

H4 T1 = SET AND HOOK UP HP'S, WATER HEATERS
P P = INSTALL TILE FLOORS & WALLS

D2 D2 = INSTALL VANITIES & KITCHEN CABINET FRAMES

V1 V1 = INSTALL STONE VANITY TOPS/ KITCHEN STONE TOPS, SHOWER ENCLOSURES & MIRRORS
V2 V2 = INSTALL PLUMBING FIXTURES

VZ = INSTALL PLUMBING FIXTURES

EH = ELECTRICAL TRIM-OUT, WIRE HP'S, WIRE WATER HEATERS AND FIXTURES, GRSD'S, ATC TRIMS

ET = INSTALL APPLIANCES, CABINETS FACES/DOORS/DRAWERS

T1 1 = INSTALL DOORS, HARDWARE & TOILET ACCESSORIES

PL = CONTRACTOR PUNCH

PS =SIGNS, FIRE EXTINGUISHERS at CORRIDORS

TB TB = TEST & BALANCE

#### MILESTONE LEGEND

TCO TCO = 1st TCO

SW = Milestone to have shaft ready for first lift rails

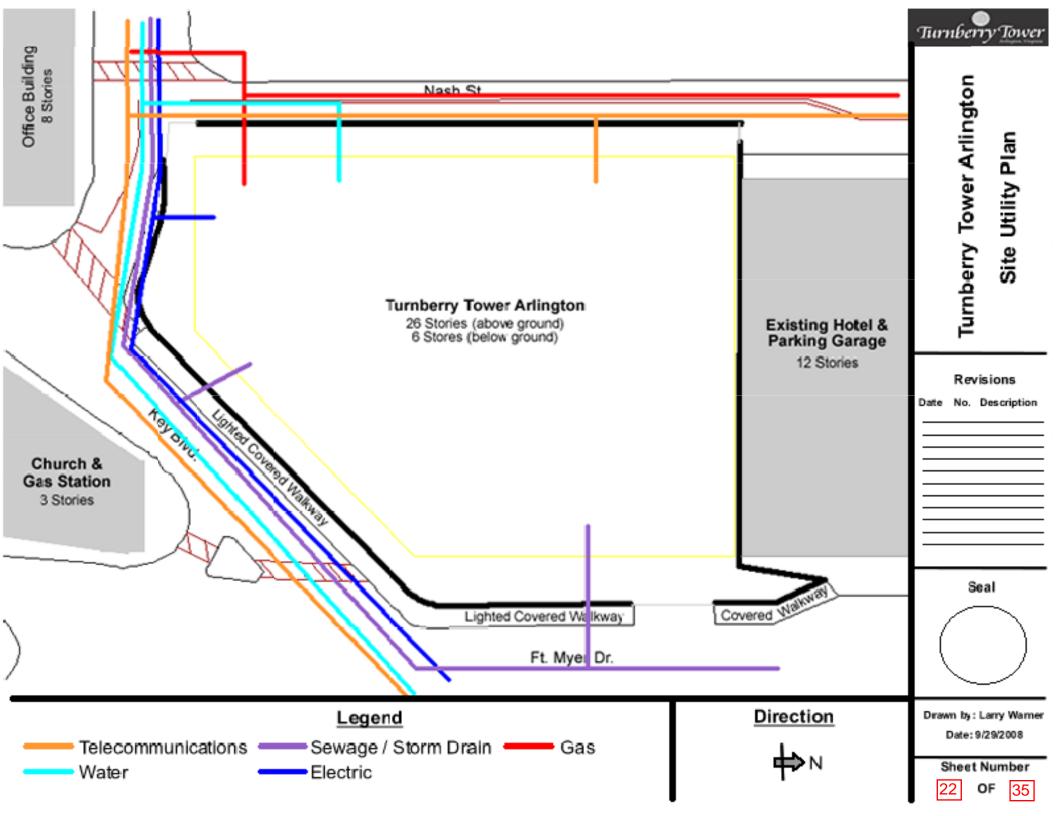

TE = Temp Elevator Ready for Use

FE = All Elevators Ready for Use

SD = Seal Deck @ T14
