

AE 481W: Penn State Architectural Engineering Senior Thesis

Salamander Hospitality Resort and Spa

Luke Renwick – Lighting/Electrical Option
AE Faculty Consultant – Professor Ted Dannerth

Technical Report 2: Lighting Existing Conditions and Design Criteria Report
November 4, 2009

Executive Summary

The following technical report contains an analysis and documentation of the electrical systems design for the Salamander Resort and Spa in Middleburg, Virginia. The 230,000 square foot resort is a multi-use hospitality venue containing 30,000 square feet of spa, indoor and outdoor pools, a restaurant, a grand ballroom, and luxury guest rooms. As a luxury resort, the lighting, electrical, and communications systems were designed to reflect and support the level of extravagance within the building.

The analysis and documentation within this report includes information on the power distribution system, service entrance, utility, voltage systems, major equipment and their electrical loads, and any special equipment featured in the electrical system. A brief description of the communications systems is also provided.

A single line diagram was created to show the electrical path from the service entrance to branch circuit panel boards, and the service entrance was sized for different phases in the design.

Section I – Power Distribution Systems

Summary Description of Distribution System

The electrical distribution system for the Salamander Resort and Spa is a simple radial system with one point of service entrance. The service entrance transformer is owned by the utility; therefore, the service feed from Dominion Power as well as the size of the service transformer is unspecified. The secondary voltage, however, is 480Y/277V, 3 Ph, 4W.

Power is distributed from the secondary side of the service transformer to two locations, a Nema 3R normal CT cabinet and a Nema 3R emergency CT cabinet to be metered. Normal power flows from the normal CT cabinet to a 3200A, 480Y/277V, 3 Ph, 4W, 65KAIC main switchboard, “MSB.” Emergency power is generated by the 650kW, 480Y/277V, 3 Ph, 4W emergency generator. The emergency power flows first to the 1200A, MLO, 480Y/277V, 3 Ph, 4W, 14KAIC emergency switchboard, “ESB.” ESB distributes power to the 75 HP fire pump and pump controller, as well as automatic transfer switches ATS-S (standby power) and ATS-E (emergency power). ATS-S serves the UPS system and any electrical panels on standby power, while ATS-E distributes power to emergency distribution panel DE4B.

Main switchboard, MSB, distributes power to mainstack chiller #1; VFD motors, P-12 and P-13; as well as to panels serving branch circuits throughout the entire building.

Utility Company Information

The utility company that provides power to the service entrance of the Salamander Resort and Spa is **Dominion Virginia Power:**

120 Tredegar Street
Richmond, VA 23261
www.dom.com/dominion-virginia-power
1-888-667-3000.

Dominion Virginia Power provides bundled rate schedules for those who purchase the supply and delivery of electric service. The Salamander Resort and Spa receives secondary voltage to the utility transformer. The 30-day rate breakdown of Dominion Power’s “Schedule GS-3: Large General Service, Secondary Voltage” is the following:

Distribution Service Charges

- i. Basic Customer Charge – \$129.73 per billing month
- ii. Plus Distribution Demand Charge – All kW of Distribution Demand @ \$2.296 per kW
- iii. Plus rkVA Demand Charge - @ \$0.162 per rkVA

Electricity Supply (ES) Service Charges

On-Peak: June 1 through September 30, 10 a.m. to 10 p.m.

- iv. On-Peak Generation Demand Charge
All On-Peak ES kW @ \$11.908 per kW
- v. Plus Off-Peak Generation Demand Charge
All Off-Peak ES kW @ \$0.690 per kW
- vi. Plus Generation Adjustment Demand Charge

All kW of Demand @ (\$0.427) per kW

vii. Plus Generation kWh Charge

All On-peak ES kWh @ 0.425¢ per kWh

All Off-peak ES kWh @ 0.286¢ per kWh

Service Entrance

Primary conductors from Dominion Virginia Power run at a minimum of 36" underground along Salamander Lane to the pad-mounted transformer near the electrical room on the basement level of Area 2. The transformer itself is owned by Dominion Power, and the primary voltage is not listed in the construction documents or specifications. The secondary power is 480Y/277V, 3PH, 4W and fed through an underground ductbank and metered by NEMA 3R CT cabinets. The service entrance feeder, rated at 4000A, is routed from the pad-mounted transformer and owned by the building owner.

The service entrance feeder is routed into the building to the "Main Distribution Frame" room, number 2B03, to the Main Switchboard, MSB.

- Owned by Dominion Power: Primary conductors to pad-mounted transformer, pad-mounted transformer
- Owned by Salamander Hospitality: 4000A feeder from pad-mounted transformer to main switchboard MSB.

Voltage Systems

- Primary service: N/A (supplied and owned by Dominion Virginia Power)
- Secondary feeder: 480Y/277V, 3 Ph, 4W
- Main switchboards "MSB" and "ESB" and distribution panels: 480Y/277V, 3 Ph, 4W
- Various electrical and dimming panels: 208Y/120V, 3 Ph, 4W
- Equipment:
 - Lighting equipment – Some exterior equipment is 277V, 1 Ph, 3W; primarily 120V, 1 Ph, 3W
 - HVAC equipment – 120V, 1Ph, 3W
208V, 1Ph, 3W
277V, 1Ph, 3W
480V, 3Ph, 4W
 - Kitchen equipment – 120V, 1Ph, 3W
208V, 1Ph, 3W
208V, 3Ph, 4W
480V, 3Ph, 4W

Emergency Power Systems

A 650kW, 480Y/277V, 3 Ph, 4W diesel generator, located in "Emergency Generator" room 2B03, distributes emergency power to automatic transfer switch ATS-E (480V, 400A, 4 Pole, 65 kAWCR). ATS-E, when switched to the emergency power position, distributes power to emergency distribution panel DE4B. DE4B feeds power to emergency panels throughout the building. Those emergency panels distribute power for life safety and fire protection equipment (egress lighting, exit signs, fire controls and equipment, elevators, jockey pump, etc.). There is also a UPS system for standby power, which is listed in the Special Equipment section.

Locations of Switchgear

The main switchboard for normal power, "MSB," is located on the Area 2 Basement electrical plan, E2.B2, and shows "MSB" in the Main Dist. Frame room, number 2B03. The automatic transfer switch for standby power, ATS-S, is also located in the Main Dist. Frame room.

The emergency switchboard, "ESB," is located on drawing E2.B2 in the "Emerg. Gen." room, number 2B04. The automatic transfer switch for emergency power, ATS-E, is also located in the Emergency Generator room.

There are main electrical closets within each major "Area" of the building, namely Areas 1-4. Main switchgear as well as electrical panels and dimming panels are located in these electrical rooms, as well as some mechanical rooms.

The following table lists those pieces of equipment, their locations within the building as well as their locations on the drawings. Note that it was discovered that more emergency electrical panels are shown in the electrical panel schedules than actually are shown on the floor plans or riser diagram. The panels listed in the following table are the electrical panels shown on the drawings as well as the electrical riser diagram.

Over-current Devices

From the service entrance, the main circuit breaker (MCB) to the main switchboard is a 3200A, 3P, 65kAIC over-current device. On the emergency power feeder, emergency generator is protected by a 1200A, 3P, 14kAIC circuit breaker. The fire pump control has a 600A, 3P MCB. The control and fire pump are a branch circuit on the Emergency Switchboard (ESB) and protected by a 225A, 3P circuit breaker. ESB and MSB protect feeders to ATS-E by use of a 400A, 3P circuit breaker, while ATS-S is protected by a 800A, 3P breaker.

The main switchboard (MSB) distributes power on 29 different feeders, for which all are protected by three-pole circuit breakers and three are set to trip at 800A, five at 600A, one at 500A, nine at 400A, four at 225A, three at 150A, three at 100A, and one at 60A. As shown on the single line diagram provided, some panels are protected by main circuit breakers and others contain main lugs only (MLO). Distribution panels are protected by circuit breakers rated at 10kAIC – 65kAIC, depending on the load of each distribution panel.

Fuses are not shown on the riser diagram, but are defined in the specifications. Fuse under 16491-3.2, applications are listed as cartridge fuses rated at 600-V ac and less for:

- Service Entrance: Class RK01, time delay
- Feeders: Class RK1, time delay
- Motor Branch Circuits: Class RK5, time delay
- Other Branch Circuits: Class RK5, time delay
- Control Circuits: Class CC, fast acting

Transformers

Within the Salamander Resort and Spa, there are forty-one (41) transformers located in electrical and mechanical rooms and each one is specified in the following table. Every transformer steps down 480Y/277V, 3Ph, 4W power to 208Y/120V, 3Ph, 4W power. The higher voltage utility/service entrance transformer is not included in the table, as it is owned by Dominion Virginia Power and its size is not specified.

INDIVIDUAL TRANSFORMER SCHEDULE								
TAG	PRIMARY VOLTAGE	SECONDARY VOLTAGE	SIZE	TYPE	TEMP. RISE	TAPS	MOUNTING	REMARKS
T1	480Y/277V, 3PH, 4W	208Y/120V, 3PH, 4W	112.5	DRY	220 DEGREE C	(2) 2.5%	PAD MOUNTED ON FLOOR	NEMA TP1
T2	480Y/277V, 3PH, 4W	208Y/120V, 3PH, 4W	75	DRY	220 DEGREE C	(2) 2.5%	PAD MOUNTED ON FLOOR	NEMA TP1
T3	480Y/277V, 3PH, 4W	208Y/120V, 3PH, 4W	75	DRY	220 DEGREE C	(2) 2.5%	PAD MOUNTED ON FLOOR	NEMA TP1
T4	480Y/277V, 3PH, 4W	208Y/120V, 3PH, 4W	45	DRY	220 DEGREE C	(2) 2.5%	PAD MOUNTED ON FLOOR	NEMA TP1
T5	480Y/277V, 3PH, 4W	208Y/120V, 3PH, 4W	45	DRY	220 DEGREE C	(2) 2.5%	PAD MOUNTED ON FLOOR	NEMA TP1
T6	480Y/277V, 3PH, 4W	208Y/120V, 3PH, 4W	30	DRY	220 DEGREE C	(2) 2.5%	PAD MOUNTED ON FLOOR	K-13 RATED
T7	480Y/277V, 3PH, 4W	208Y/120V, 3PH, 4W	75	DRY	220 DEGREE C	(2) 2.5%	PAD MOUNTED ON FLOOR	NEMA TP1
T8	480Y/277V, 3PH, 4W	208Y/120V, 3PH, 4W	75	DRY	220 DEGREE C	(2) 2.5%	PAD MOUNTED ON FLOOR	NEMA TP1
T9	480Y/277V, 3PH, 4W	208Y/120V, 3PH, 4W	75	DRY	220 DEGREE C	(2) 2.5%	PAD MOUNTED ON FLOOR	NEMA TP1
T10	480Y/277V, 3PH, 4W	208Y/120V, 3PH, 4W	75	DRY	220 DEGREE C	(2) 2.5%	PAD MOUNTED ON FLOOR	NEMA TP1
T11	480Y/277V, 3PH, 4W	208Y/120V, 3PH, 4W	75	DRY	220 DEGREE C	(2) 2.5%	PAD MOUNTED ON FLOOR	NEMA TP1
T12	480Y/277V, 3PH, 4W	208Y/120V, 3PH, 4W	75	DRY	220 DEGREE C	(2) 2.5%	PAD MOUNTED ON FLOOR	NEMA TP1

INDIVIDUAL TRANSFORMER SCHEDULE

TAG	PRIMARY VOLTAGE	SECONDARY VOLTAGE	SIZE	TYPE	TEMP. RISE	TAPS	MOUNTING	REMARKS

NOTES:

1. TAG DESIGNATIONS ARE AS FOLLOWS: T# IS NEMA TP1 TRANSFORMER, T#K IS MINIMUM K13 RATED TRANSFORMER, AND T#G IS MINIMUM K13 RATED TRANSFORMER WITH ISOLATED GROUND ON SECONDARY.
2. PROVIDE NEUTRAL TO GROUND BONDING JUMPER OF TRANSFORMER. PROVIDE GROUNDING ELECTRODE CONDUCTOR FROM GROUNDED NEUTRAL TO THE NEAREST EFFECTIVELY GROUNDED METAL MEMBER OF STRUCTURE, WATER PIPE AND/OR ONE OF THE METHODS LISTED IN NEC 250.
3. BOND NEUTRAL OF TRANSFORMER SECONDARY TO THE TRANSFORMER CASE WITH BONDING JUMPER AS PER NATIONAL ELECTRIC CODE.
4. SECONDARY OVER-CURRENT PROTECTION SHALL BE LOCATED WITH TEN FEET OF THE TRANSFORMER SECONDARY TERMINALS EITHER IN A PANELBOARD (MAIN BREAKER) OR AN INDIVIDUALLY MOUNTED CIRCUIT BREAKER.

Grounding

The extent to which this building is grounded is shown in the Grounding Riser Diagram on drawing E6.2. A telecommunications grounding riser diagram is also shown on drawing AV0.200. Telecommunication equipment grounding details are shown on drawing LV5.200.

Special Equipment

The Salamander Resort and Spa is equipped with an uninterruptible power supply (UPS), which is energized through the standby power automatic transfer switch, ATS-S. The 80kVA NPower UPS (480-208Y/120V) is located in the Area 2 basement level in room #2B27 ("I.T." room). Batteries provide 15 minutes of 100% power. Harmonic filtering is a maximum of 10% THD at 100% non-linear loading.

The UPS distributes power to distribution panel DS4B, which then feeds electrical panels on standby power. Equipment on standby power includes guest room receptacles and lighting, CCTV cameras, fire extinguishing systems, automatic door hardware, AV racks, elevators, and pumps.

Lighting Loads

The typical lighting systems found within the Salamander Resort and Spa are highly decorative. Custom designed decorative chandeliers and wall sconces are prevalent in almost every space. Incandescent and halogen light sources are primarily used to emphasize the feeling of relaxation. The lighting systems add to the elegant and decorative interior design of the high-end spaces. Almost all lamps used are incandescent candelabras (chandeliers and sconces) and MR-16's (downlights).

The following Luminaire Schedule lists the luminaire tag, number of lamps, type of lamp, lamp wattage, ballast type, voltage, total input watts to the luminaire, ballast factor, operating current, and power factor. This table does not include the custom decorative chandeliers and wall sconces (DP and DS series), as their specifications are not as clearly defined in the construction documents. Some luminaire information has been left out of the existing schedule and will be labeled as "NA."

All manufacturers' catalog cuts/specifications for HID lamp/ballast combinations are included in Appendix B at the end of this report.

Lighting Control

- ASHRAE/IESNA 90.1 shutoff requirement compliancy:
The Salamander Resort and Spa is equipped with automatic shutoff in the form of both time switches and occupancy sensors for indoor and outdoor spaces.
 - Time switches are electronic, solid-state programmable units with alphanumeric display. Each time switch has eight channels; each channel shall be individually programmable with 40 on-off operations per week, plus 4 seasonal schedules.
 - Indoor occupancy sensors are wall or ceiling-mounted, solid-state units with separate relay units. Passive Infrared, Ultrasonic, and Dual-Technology type sensors are utilized throughout the building.
- Lighting control systems:
 - Time switches (listed above)
 - Outdoor and indoor photoelectric switches:
 - Solid state, with DPST dry contacts rated for 1800-VA tungsten or 1000-VA inductive, to operate connected relay, contactor coils, or microprocessor input.
 - Indoor/outdoor occupancy sensors (listed above)
 - Outdoor motion sensors
 - Lighting contactors:
 - Electrically operated and mechanically held, combination type with fusible switch and non-fused disconnect.
 - Emergency shunt relays:
 - Normally closed, electrically held relay, arranged for wiring in parallel with manual or automatic switching contacts.
 - Dimming:
 - Complete functioning dimming systems; solid-state; all spaces shall be controlled with a minimum of four preset scenes; five button preset scene controls, master raise/lower, master control touch screen. Grafik eye 7000 control

Mechanical and Other Loads

Mechanical systems throughout the building cover a broad range of technologies. There are over twenty air handling units, equipped with cooling and heating coils. Air flow is distributed by constant and variable air volume, depending on different areas of the building. Heat recovery is prevalent throughout the spa and pool areas. Heating and cooling within the guest room lodging wing is done by vertical fan coil units. Power is needed to run boilers, chillers, air handlers, exhaust fans, air conditioners, fan coil units, pumps, variable frequency drives, unit heaters, etc.

Other loads in the Salamander Resort and Spa come from kitchen and laundry equipment. Various types of equipment and their motors must receive power for normal activities in the food preparation and laundry areas of the resort. Anything from coffee brewers and convection ovens to washers and dryers must operate on electricity.

The following Mechanical Equipment, Kitchen Equipment, and Laundry Equipment schedules include the individual piece of equipment's tag; quantity; description; load in kW, HP, minimum current ampacity (MCA), or kW; motor amps (if a motor load); voltage; number of phases; assumed power factor; and calculated kVA or kW. If a value in the schedule is listed as "NA" or left blank, that information was not provided in the construction documents.

MECHANICAL/PLUMBING EQUIPMENT SCHEDULE

Service Entrance Size

The following is a summary of three different calculations made to size the service entrance. The first sizing method is made for the Conceptual or Schematic Design phase, where the building square footage is multiplied by a demand load in VA/sq.ft. based on general building types. The second calculation, for the Design Development phase, is determined by adding demand loads in VA/sq.ft. for different specific loads in the building, such as lighting and receptacles. The third calculation method is completed based on actual building loads and NEC demand factors. The breakdown of each calculation method is shown in the summary below.

Service Entrance Size Calculation - Conceptual/Schematic Design		
Building Square Footage	VA/sq.ft.	Load - VA
230,000	12	2760000

Service Entrance Size Calculation - Design Development			
Receptacles			
	VA/sq.ft.	Building Sq.ft.	Load - kVA
	0.5	230000	115
HVAC - cooling			
	VA/sq.ft.	Building Sq.ft.	Load - kVA
	8	230000	1840
Kitchen - full service			
	VA/sq.ft.	Building Sq.ft.	Load - kVA
	20	10000	200
Lighting			
	VA/sq.ft.	Building Sq.ft.	Load - kVA
	2	230000	460
Lighting demand factors: NEC Table 220.42			
First 20 kVA: 50%	10 kVA	Load - kVA	
20 kVA - 100kVA: 40%	32 kVA		
> 100 kVA: 30%	125 kVA		
TOTAL	167 kVA	167	
Elevators			
50 kW/elevator x 6 elevators = 300kW	Load - kVA		
Load - Amps			
		333.33	
115kVA + 1840kVA + 200kVA + 167kVA + 333 kVA = 2655 kVA ==> 3193.5 A			

Service Entrance Size Calculation - Working Drawings		
LOAD	CONNECTED LOAD (kVA)	DEMAND LOAD (kVA)
Lighting	157.5	59.25
Receptacles	562	286
Mechanical/Plumbing Equip.	1477	1477
Kitchen Equipment	164.8	164.6
Laundry Equipment	63.7	63.7
Fitness Room Equipment	20.4	20.4
AV Equipment	38	38
Fountains	36.5	36.5
Dimming Panels	210	190
Total kVA		2335.45
Total Current (A)		2809.1

Service Entrance Size			
Phase	Load - kVA	Voltage System	Load - Amps
Conceptual/Schematic Design	2760	480Y/277V, 3PH, 4W	3319.8
Design Development	2655	480Y/277V, 3PH, 4W	3193.5
Working Drawings	2335.45	480Y/277V, 3PH, 4W	2809.1
Actual Conditions - Service Entrance	2660	480Y/277V, 3PH, 4W	3200

VA/sq.ft. for 230,000 sq.ft	11.6
-----------------------------	------

In comparing the three service entrance sizes above, the conceptual/schematic and design development phase service sizes are relatively close to the actual conditions service entrance size. The working drawings load calculation resulted in a slightly undersized service, however. This is likely due to the fact that complete loads for communication systems were not provided in the working drawings set.

Environmental Stewardship Design

The Salamander Resort and Spa design team has taken great effort to become one of the only hospitality resorts to gain LEED Certification. Therefore, the electrical design must pass the USGBC LEED electrical requirements for certification. No special electrical systems have been implemented, however. Most LEED credit is awarded for energy efficient equipment.

Design Issues

On a site visit to Middleburg in late August 2009, the electrical contractor described problems with the electrical design in which feeders were routed at too great of a length to the lodging wing without having an intermediate electrical room for the spa wing (Area 3) basement. A janitor's closet near the indoor pool was modified to become that intermediate electrical room. This design issue of extensive feeder lengths between distribution panels and branch circuits may be an area of interest.

Section II - Communication Systems

Audio Visual Systems

The Salamander Resort and Spa contains fourteen Audio Visual presentation room/area types (ballroom, board rooms, meeting rooms, hospitality suite, fitness center, movement studio, library, living room, win bar, billiards room, spa area, indoor pool, spa café, cooking studio, restaurant, whole house audio and video). AV systems include, but are not limited, to DVD/CD players, speaker audio systems, portable laptop input jacks, videoconferencing and audio conferencing capabilities, wireless microphones, volume controls, touch panel controls, plasma and or LCD displays, satellite TV capability, audio from MP3 servers and BOH system,

Telecommunication Systems

The main communications equipment is located in the IDF low voltage termination room, found in Area 2 of the building on the basement level. Telecommunication systems are distributed throughout the building, providing voice and data outlets to most spaces. Wireless access points are also distributed throughout the resort to provide internet to guests. Guest room desk "jack pack plates" include outlets for the following: A/V, S-Video, PC Audio/VGA, HDMI, mp3 dock, internet, USB. Most equipment is placed on the UPS standby power, which is also located in the IDF room.

Security Systems

The security system throughout the building is a complete IP Video Surveillance System (IPVS), which includes IPVS cameras (wide dynamic range; sensor input; alarm output; audio support; exterior pan-tilt-zoom), IPVS recording systems (network access; video recording; video server), fixed indoor camera power supplies, exterior and PTZ camera power supplies (24VAC; 48VA minimum), IPVS system cabling, network switches, an alternate analog CCTV system (cameras, DVRs), and a panic alarm system (Sentrol Panic Button, ATW Panic Alarm).

Appendix B – H.I.D. Lamps/Ballasts

Luminaire Tag: OE & OF – 1 lamp/luminaire

Ballast Type: Electronic

Philips MasterColor® Ceramic Metal Halide 39 Watt 4000K Tubular Single-Ended T6 Lamps

Ordering Information

Ordering Code	CDM35/T6/842
ANSI Designation	M130/E
Product Number	208868
Description	MasterColor Ceramic Metal Halide
Package Qty.	12

Physical Characteristics

Bulb Size	T-6
Bulb Finish	Clear
Base	G-12 Bi-Pin
Max. Overall Length (MOL)	3 15/16" (100 mm)
Light Center Length (LCL)	2 7/32" (56 mm)
Arc Length	0.2" (5 mm)
Arc Tube Material	Polycrystalline Alumina
Max. Permissible Bulb Temp.	500°C (932°F)
Max. Permissible Base Temp.	280°C (536°F)
Max. Bulb to Base Eccentricity	3°
Max. Arc Tube to Base Eccentricity	3°

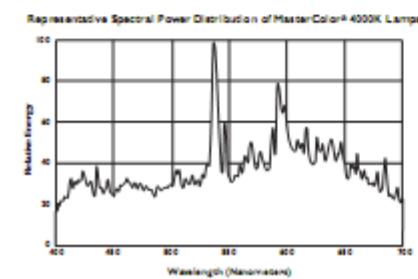

Operating Characteristics (Photometric)

Initial Lumens, Approx. ¹	3300
Mean Lumens, Approx. ²	2800
Rated Average Life, Hours ³	6,000
Correlated Color Temp. (CCT) ⁴	4200K
CIE Chromaticity, Approx. ¹	x=.365, y=.364
Color Rendering Index (CRI)	84
Efficacy (lpw)	81

Operating Position

Universal-Enclosed Luminaires Only

Note: Use only on thermally protected electronic ballast.

Philips MasterColor® Ceramic Metal Halide 39 Watt 4000K Tubular Single-Ended T6 Lamps

Electrical Data (Subject to change without notice)

Lamp Watts (Nominal)	39
Lamp Operating Voltage (rms) (Nominal) ⁵	85
Initial Lamp Voltage Range (rms)	77-93
Lamp Operating Current (Amps) (rms) (Nominal)	0.46
Lamp Current Crest Factor (Maximum)	1.8
Warm-up Time to 80% of Output	2 Minutes
Re-strike Time for Hot Lamp	4-8 Minutes
Ballast Type	ANSI M130/E
Ballast Open Circuit Voltage (Minimum)	198
Pulse Peak Volts	3000 Min, 4000 Max.
Pulse Width @ 90% Peak	2 Micro Second Min.
Pulse Repetition Rate (Minimum)*	2 per Half Cycle
Minimum Operating Temperature	-30°C

¹) Measured at 100 hrs. life. Approximate lumen values listed are for service operation of the lamp.²) Approximate lumen output at 40% of lamp rated average life.³) Rated average life is the life attained, on the average, from large representative groups of lamps in laboratory tests under controlled conditions at 10 or more operating hours per start. It is based on survival of at least 50% of the lamps and allows for individual lamps or groups of lamps to vary considerably from the average.⁴) Measured at rated lamp watts on a linear reactor. LPW does not include ballast losses.⁵) Measured with the lamp operating at rated watts.⁶) Option-Pulse Width @ 90% Peak, 1 micro second minimum with 2 pulses per half cycle.

Luminaire Tag: OE & OF – 1 lamp/luminaire

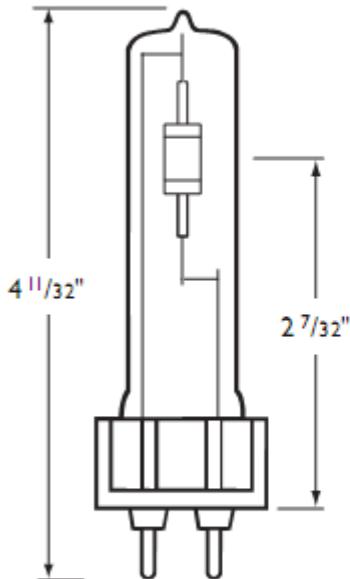

Ballast Type: Electronic

PHILIPS ADVANCE		e-Vision® Electronic Ballast for Metal Halide Lamps	Catalog Number: IMH-P39-G For 39W Philips Mini Master Color Lamps ANSI C179 120-277 50/60Hz Electronic Status: RELEASED						
DIMENSIONS AND DATA									
Lamp			Line Current (Amps)	Input Power (Watts)	Min Power Factor	Wiring Diag	Fig.	Weight (lb)	Max. Distance to Lamp (ft)
Number	Watts	Input Volts	Catalog Number*						
1	39	120 277	IMH-P39-G-XXX	0.39 0.17	46 45	0.95	3	G	0.9 5
39W Watt Lamp, ANSI Code C179 Minimum Starting Temp -30°C/-20°F									
Case Figure	Overall Length	Case Length	Case Width	Height	Mountin Length	Mounting Width	Ballast		
G	97mm [3.8"]	90mm [3.5"]	77mm [3.0"]	30mm [1.2"]	87mm [3.4"]	67mm [2.6"]	(Red)	(Blue)	Lamp
Wiring Diagram 3									
INSTALLATION & APPLICATION NOTES: <ol style="list-style-type: none"> Maximum allowable case temperature is 90°C. See figure above for measurement location Ignition pulse is 2.5 kV max All leads are 9 inches long Ballast output will shutdown after 20 minutes if lamp fails to ignite Power must be cycled off – then on, after replacing lamp 									
Data is based on tests performed by Philips Advance in a controlled environment and is representative of relative performance. Actual performance can vary depending on operating conditions. Specifications are subject to change without notice. All specifications are nominal unless otherwise noted.
